# Texture Synthesis

15-463: Rendering and Image Processing  
Alexei Efros

## Weather Forecasting for Dummies™

---

Let's predict weather:

- Given today's weather only, we want to know tomorrow's
- Suppose weather can only be {Sunny, Cloudy, Raining}

The Weather Channel algorithm:

- Over a long period of time, record:
  - How often S followed by R
  - How often S followed by S
  - Etc.
- Compute percentages for each state:
  - $P(R|S)$ ,  $P(S|S)$ , etc.
- Predict the state with highest probability!
- It's a Markov Chain

## Markov Chain

What if we know today and yesterday's weather?

## Text Synthesis

[Shannon, '48] proposed a way to generate English-looking text using N-grams:

- Assume a generalized Markov model
- Use a large text to compute prob. distributions of each letter given N-1 previous letters
- Starting from a seed repeatedly sample this Markov chain to generate new letters
- Also works for whole words

**WE NEED TO EAT CAKE**

## Mark V. Shaney (Bell Labs)

---

Results (using `alt.singles` corpus):

- *“As I've commented before, really relating to someone involves standing next to impossible.”*
- *“One morning I shot an elephant in my arms and kissed him.”*
- *“I spent an interesting evening recently with a grain of salt”*

# Video Textures

## Video clips

## Video textures

## Problem statement

video clip

video texture

## Our approach

- How do we find good transitions?

## Finding good transitions

- Compute  $L_2$  distance  $D_{i,j}$  between all frames

Similar frames make good transitions

## Markov chain representation

Similar frames make good transitions

## Transition costs

- Transition from  $i$  to  $j$  if successor of  $i$  is similar to  $j$ 
  - Cost function:  $C_{i \rightarrow j} = D_{i+1, j}$

## Transition probabilities

- Probability for transition  $P_{i \rightarrow j}$  inversely related to cost:

$$P_{i \rightarrow j} \sim \exp(-C_{i \rightarrow j} / \sigma^2)$$

high  $\sigma$

low  $\sigma$

## Preserving dynamics

## Preserving dynamics

## Preserving dynamics

- Cost for transition  $i \rightarrow j$

$$C_{i \rightarrow j} = \sum_{k=-N}^{N-1} w_k D_{i+k+1, j+k}$$

## Preserving dynamics – effect

- Cost for transition  $i \rightarrow j$ 
  - $$C_{i \rightarrow j} = \sum_{k=-N}^{N-1} w_k D_{i+k+1, j+k}$$

## Dead ends

- No good transition at the end of sequence

## Future cost

- Propagate future transition costs backward
- Iteratively compute new cost

- $F_{i \rightarrow j} = C_{i \rightarrow j} + \alpha \min_k F_{j \rightarrow k}$

## Future cost

- Propagate future transition costs backward
- Iteratively compute new cost

- $F_{i \rightarrow j} = C_{i \rightarrow j} + \alpha \min_k F_{j \rightarrow k}$

## Future cost

- Propagate future transition costs backward
- Iteratively compute new cost

- $F_{i \rightarrow j} = C_{i \rightarrow j} + \alpha \min_k F_{j \rightarrow k}$

## Future cost

- Propagate future transition costs backward
- Iteratively compute new cost

- $F_{i \rightarrow j} = C_{i \rightarrow j} + \alpha \min_k F_{j \rightarrow k}$

## Future cost

- Propagate future transition costs backward
- Iteratively compute new cost

$$F_{i \rightarrow j} = C_{i \rightarrow j} + \alpha \min_k F_{j \rightarrow k}$$

- Q-learning

## Future cost – effect

## Finding good loops

- Alternative to random transitions
- Precompute set of loops up front

## Visual discontinuities

- Problem: Visible “Jumps”

## Crossfading

- Solution: Crossfade from one sequence to the other.

## Morphing

- Interpolation task:

$$\frac{2}{5} \boxed{A} + \frac{2}{5} \boxed{B} + \frac{1}{5} \boxed{C}$$

## Morphing

- Interpolation task:

$$\frac{2}{5} \boxed{A} + \frac{2}{5} \boxed{B} + \frac{1}{5} \boxed{C}$$

- Compute correspondence between pixels of all frames

## Morphing

- Interpolation task:

$$\frac{2}{5} \boxed{A} + \frac{2}{5} \boxed{B} + \frac{1}{5} \boxed{C}$$

- Compute correspondence between pixels of all frames
- Interpolate pixel position and color in morphed frame
- based on [Shum 2000]

## Results – crossfading/morphing

## Results – crossfading/morphing

Jump Cut

Crossfade

Morph

## Crossfading

## Frequent jump & crossfading

## Video portrait

- Useful for web pages

## Region-based analysis

- Divide video up into regions

- Generate a video texture for each region

## Automatic region analysis

## Video-based animation

- Like sprites in computer games
- Extract sprites from real video
- Interactively control desired motion

## Video sprite extraction

## Video sprite control

- Augmented transition cost:

$$C_{i \rightarrow j}^{\text{Animation}} = \underbrace{\alpha C_{i \rightarrow j}}_{\text{Similarity term}} + \underbrace{\beta \text{ angle}}_{\text{Control term}}$$

vector to mouse pointer  
velocity vector

## Interactive fish

## Lord of the Flies

## Summary

- Video clips → video textures
  - define Markov process
  - preserve dynamics
  - avoid dead-ends
  - disguise visual discontinuities

## Texture

- Texture depicts spatially repeating patterns
- Many natural phenomena are textures

radishes

rocks

yogurt

## Texture Synthesis

- Goal of Texture Synthesis: create new samples of a given texture
- Many applications: virtual environments, hole-filling, texturing surfaces

## The Challenge

- Need to model the whole spectrum: from repeated to stochastic texture

**repeated**

**stochastic**

**Both?**

## Efros & Leung Algorithm

- Assuming Markov property, compute  $P(\mathbf{p}|\mathbf{N}(\mathbf{p}))$ 
  - Building explicit probability tables infeasible
  - Instead, we *search the input image* for all similar neighborhoods — that's our pdf for  $\mathbf{p}$
  - To sample from this pdf, just pick one match at random

## Some Details

- Growing is in “onion skin” order
  - Within each “layer”, pixels with most neighbors are synthesized first
  - If no close match can be found, the pixel is not synthesized until the end
- Using *Gaussian-weighted* SSD is very important
  - to make sure the new pixel agrees with its closest neighbors
  - Approximates reduction to a smaller neighborhood window if data is too sparse

## Neighborhood Window

## Varying Window Size

## Synthesis Results

french canvas

rafia weave

## More Results

# Hole Filling

## Extrapolation

## Summary

- The Efros & Leung algorithm
  - Very simple
  - Surprisingly good results
  - Synthesis is easier than analysis!
  - ...but very slow

# Image Quilting [Efros & Freeman]

- Observation: neighbor pixels are highly correlated

Idea: unit of synthesis = block

- Exactly the same but now we want  $P(B|N(B))$
- Much faster: synthesize all pixels in a block at once
- Not the same as multi-scale!

## Minimal error boundary

## Our Philosophy

- The “Corrupt Professor’s Algorithm”:
  - Plagiarize as much of the source image as you can
  - Then try to cover up the evidence
- Rationale:
  - Texture blocks are by definition correct samples of texture so problem only connecting them together

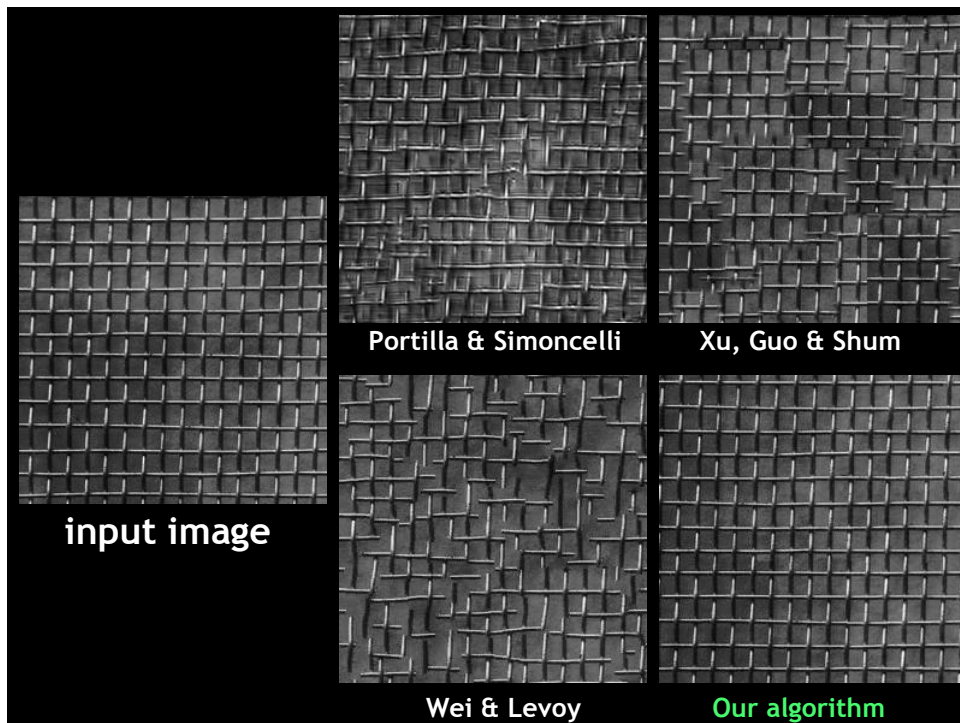

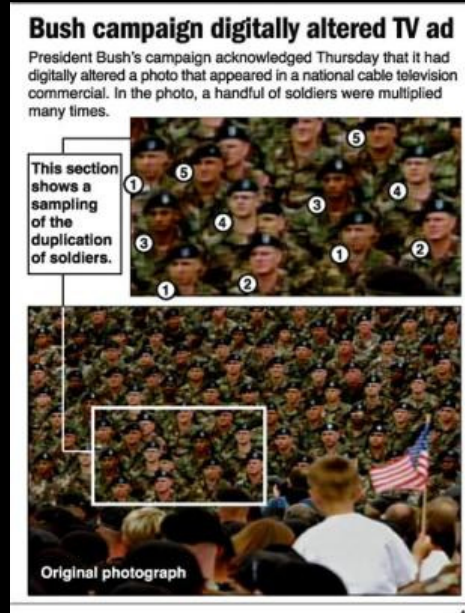

## Political Texture Synthesis!

## Application: Texture Transfer

- Try to explain one object with bits and pieces of another object:

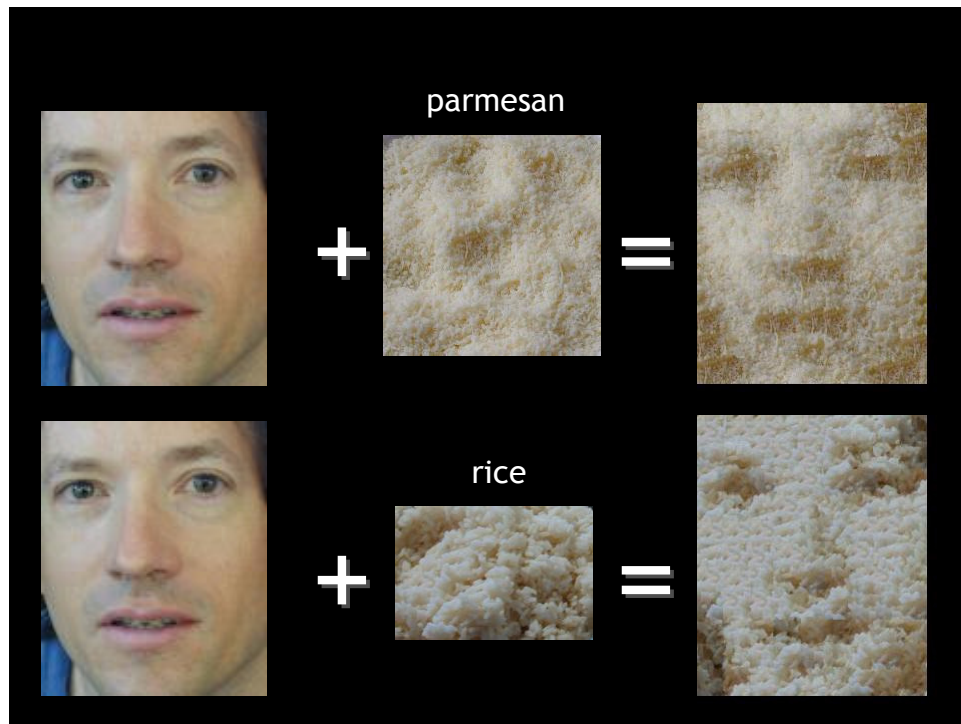

Same as texture synthesis, except an additional constraint:

1. Consistency of texture
2. Similarity to the image being “explained”

## Image Analogies
