# Triangulation

Create two points on the ray:

- 1) find the camera center; and
  - 2) apply the pseudo-inverse of  $\mathbf{P}$  on  $\mathbf{x}$ .
- Then connect the two points.

# Recall: Cross Product

## Vector (cross) product

takes two vectors and returns a vector perpendicular to both

$$a \times b = \begin{bmatrix} a_2b_3 - a_3b_2 \\ a_3b_1 - a_1b_3 \\ a_1b_2 - a_2b_1 \end{bmatrix}$$

cross product of two vectors in the same direction is zero

$$a \times a = 0$$

remember this!!!

$$c \cdot a = 0$$

$$c \cdot b = 0$$

$$\mathbf{x} = \alpha \mathbf{P} \mathbf{X}$$

Same direction but differs by a scale factor

$$\mathbf{x} \times \mathbf{P} \mathbf{X} = \mathbf{0}$$

Cross product of two vectors of same direction is zero  
(this equality removes the scale factor)

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} \text{---} & \boldsymbol{p_1}^\top & \text{---} \\ \text{---} & \boldsymbol{p_2}^\top & \text{---} \\ \text{---} & \boldsymbol{p_3}^\top & \text{---} \end{bmatrix} \begin{bmatrix} | \\ \boldsymbol{X} \\ | \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} \boldsymbol{p_1}^\top \boldsymbol{X} \\ \boldsymbol{p_2}^\top \boldsymbol{X} \\ \boldsymbol{p_3}^\top \boldsymbol{X} \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} \text{---} & \mathbf{p_1^\top} & \text{---} \\ \text{---} & \mathbf{p_2^\top} & \text{---} \\ \text{---} & \mathbf{p_3^\top} & \text{---} \end{bmatrix} \begin{bmatrix} | \\ \mathbf{X} \\ | \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \alpha \begin{bmatrix} \mathbf{p_1^\top X} \\ \mathbf{p_2^\top X} \\ \mathbf{p_3^\top X} \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \times \begin{bmatrix} \mathbf{p_1^\top X} \\ \mathbf{p_2^\top X} \\ \mathbf{p_3^\top X} \end{bmatrix} = \begin{bmatrix} y\mathbf{p_3^\top X} - \mathbf{p_2^\top X} \\ \mathbf{p_1^\top X} - x\mathbf{p_3^\top X} \\ x\mathbf{p_2^\top X} - y\mathbf{p_1^\top X} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Using the fact that the cross product should be zero

$$\mathbf{x} \times \mathbf{P}\mathbf{X} = \mathbf{0}$$

$$\begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \times \begin{bmatrix} \mathbf{p}_1^\top \mathbf{X} \\ \mathbf{p}_2^\top \mathbf{X} \\ \mathbf{p}_3^\top \mathbf{X} \end{bmatrix} = \begin{bmatrix} y\mathbf{p}_3^\top \mathbf{X} - \mathbf{p}_2^\top \mathbf{X} \\ \mathbf{p}_1^\top \mathbf{X} - x\mathbf{p}_3^\top \mathbf{X} \\ x\mathbf{p}_2^\top \mathbf{X} - y\mathbf{p}_1^\top \mathbf{X} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Third line is a linear combination of the first and second lines.  
(x times the first line plus y times the second line)

One 2D to 3D point correspondence give you  equations

Using the fact that the cross product should be zero

$$\mathbf{x} \times \mathbf{P}\mathbf{X} = \mathbf{0}$$

$$\begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \times \begin{bmatrix} \mathbf{p}_1^\top \mathbf{X} \\ \mathbf{p}_2^\top \mathbf{X} \\ \mathbf{p}_3^\top \mathbf{X} \end{bmatrix} = \begin{bmatrix} y\mathbf{p}_3^\top \mathbf{X} - \mathbf{p}_2^\top \mathbf{X} \\ \mathbf{p}_1^\top \mathbf{X} - x\mathbf{p}_3^\top \mathbf{X} \\ x\mathbf{p}_2^\top \mathbf{X} - y\mathbf{p}_1^\top \mathbf{X} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Third line is a linear combination of the first and second lines.  
(x times the first line plus y times the second line)

One 2D to 3D point correspondence give you 2 equations

$$\begin{bmatrix} y\mathbf{p}_3^\top \mathbf{X} - \mathbf{p}_2^\top \mathbf{X} \\ \mathbf{p}_1^\top \mathbf{X} - x\mathbf{p}_3^\top \mathbf{X} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} y\mathbf{p}_3^\top - \mathbf{p}_2^\top \\ \mathbf{p}_1^\top - x\mathbf{p}_3^\top \end{bmatrix} \mathbf{X} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\mathbf{A}_i \mathbf{X} = \mathbf{0}$$

Now we can make a system of linear equations  
(two lines for each 2D point correspondence)

Concatenate the 2D points from both images

$$\begin{bmatrix} y\mathbf{p}_3^\top - \mathbf{p}_2^\top \\ \mathbf{p}_1^\top - x\mathbf{p}_3^\top \\ y'\mathbf{p}'_3{}^\top - \mathbf{p}'_2{}^\top \\ \mathbf{p}'_1{}^\top - x'\mathbf{p}'_3{}^\top \end{bmatrix} \mathbf{X} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

*sanity check! dimensions?*

$$\mathbf{A}\mathbf{X} = \mathbf{0}$$

*How do we solve homogeneous linear system?*

Concatenate the 2D points from both images

$$\begin{bmatrix} y\mathbf{p}_3^\top - \mathbf{p}_2^\top \\ \mathbf{p}_1^\top - x\mathbf{p}_3^\top \\ y'\mathbf{p}_3'^\top - \mathbf{p}_2'^\top \\ \mathbf{p}_1'^\top - x'\mathbf{p}_3'^\top \end{bmatrix} \mathbf{X} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\mathbf{A}\mathbf{X} = \mathbf{0}$$

(**Warning:** change of notation.  $\mathbf{x}$  is a vector of parameters!)

$$\begin{aligned} E_{\text{TLS}} &= \sum_i (\mathbf{a}_i \mathbf{x})^2 \\ &= \|\mathbf{A}\mathbf{x}\|^2 && \text{(matrix form)} \\ \|\mathbf{x}\|^2 &= 1 && \text{constraint} \end{aligned}$$

$$\begin{array}{ll} \text{minimize} & \|\mathbf{A}\mathbf{x}\|^2 \\ \text{subject to} & \|\mathbf{x}\|^2 = 1 \end{array} \quad \rightarrow \quad \begin{array}{ll} \text{minimize} & \frac{\|\mathbf{A}\mathbf{x}\|^2}{\|\mathbf{x}\|^2} \\ & \text{(Rayleigh quotient)} \end{array}$$

*How do you compute the epipolar line?*

The essential matrix

# Recall: Epipolar constraint

Potential matches for  $x$  lie on the epipolar line  $l'$

Given a point in one image,  
multiplying by the **essential matrix** will tell us  
the **epipolar line** in the second view.

$$\mathbf{E}x = l'$$

# Motivation

The Essential Matrix is a  $3 \times 3$  matrix that encodes **epipolar geometry**

Given a point in one image,  
multiplying by the **essential matrix** will tell us  
the **epipolar line** in the second view.

Representing the ...

# Epipolar Line

$$ax + by + c = 0 \quad \text{in vector form} \quad \mathbf{l} = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

If the point  $\mathbf{x}$  is on the epipolar line  $\mathbf{l}$  then

# Epipolar Line

$$ax + by + c = 0 \quad \text{in vector form} \quad \boldsymbol{l} = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

If the point  $\boldsymbol{x}$  is on the epipolar line  $\boldsymbol{l}$  then

$$\boldsymbol{x}^\top \boldsymbol{l} = 0$$

# Recall: Dot Product

$$c \cdot a = 0$$

$$c \cdot b = 0$$

dot product of two orthogonal vectors is zero

vector representing the line is  
normal (orthogonal) to the plane

$$l = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

vector representing the point  $x$  is

Therefore:

$$x^{\top} l = 0$$

So if  $\mathbf{x}^\top \mathbf{l} = 0$  and  $\mathbf{E}\mathbf{x} = \mathbf{l}'$  then

$$\mathbf{x}'^\top \mathbf{E}\mathbf{x} = ?$$

$$\begin{bmatrix} x'_m & y'_m & 1 \end{bmatrix} \begin{bmatrix} f_1 & f_2 & f_3 \\ f_4 & f_5 & f_6 \\ f_7 & f_8 & f_9 \end{bmatrix} \begin{bmatrix} x_m \\ y_m \\ 1 \end{bmatrix} = 0$$

*How many equation do you get from one correspondence?*

$$\begin{bmatrix} x'_m & y'_m & 1 \end{bmatrix} \begin{bmatrix} f_1 & f_2 & f_3 \\ f_4 & f_5 & f_6 \\ f_7 & f_8 & f_9 \end{bmatrix} \begin{bmatrix} x_m \\ y_m \\ 1 \end{bmatrix} = 0$$

ONE correspondence gives you ONE equation

$$\begin{aligned} x_m x'_m f_1 + x_m y'_m f_2 + x_m f_3 + \\ y_m x'_m f_4 + y_m y'_m f_5 + y_m f_6 + \\ x'_m f_7 + y'_m f_8 + f_9 = 0 \end{aligned}$$

$$\begin{bmatrix} x'_m & y'_m & 1 \end{bmatrix} \begin{bmatrix} f_1 & f_2 & f_3 \\ f_4 & f_5 & f_6 \\ f_7 & f_8 & f_9 \end{bmatrix} \begin{bmatrix} x_m \\ y_m \\ 1 \end{bmatrix} = 0$$

Set up a homogeneous linear system with 9 unknowns

$$\begin{bmatrix} x_1 x'_1 & x_1 y'_1 & x_1 & y_1 x'_1 & y_1 y'_1 & y_1 & x'_1 & y'_1 & 1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ x_M x'_M & x_M y'_M & x_M & y_M x'_M & y_M y'_M & y_M & x'_M & y'_M & 1 \end{bmatrix} \begin{bmatrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \\ f_6 \\ f_7 \\ f_8 \\ f_9 \end{bmatrix} = \mathbf{0}$$

*How many equations do you need?*

Each point pair (according to epipolar constraint)  
contributes only one scalar equation

$$\mathbf{x}_m'^\top \mathbf{F} \mathbf{x}_m = 0$$

**Note:** This is different from the Homography estimation where  
each point pair contributes 2 equations.

We need at least 8 points

**Hence, the 8 point algorithm!**

# Enforcing rank constraints

**Problem:** Given a matrix  $F$ , find the matrix  $F'$  of rank  $k$  that is closest to  $F$ ,

$$\min_{\substack{F' \\ \text{rank}(F')=k}} \|F - F'\|^2$$

**Solution:** Compute the singular value decomposition of  $F$ ,

$$F = U\Sigma V^T$$

Form a matrix  $\Sigma'$  by replacing all but the  $k$  largest singular values in  $\Sigma$  with 0.

Then the problem solution is the matrix  $F'$  formed as,

$$F' = U\Sigma'V^T$$
