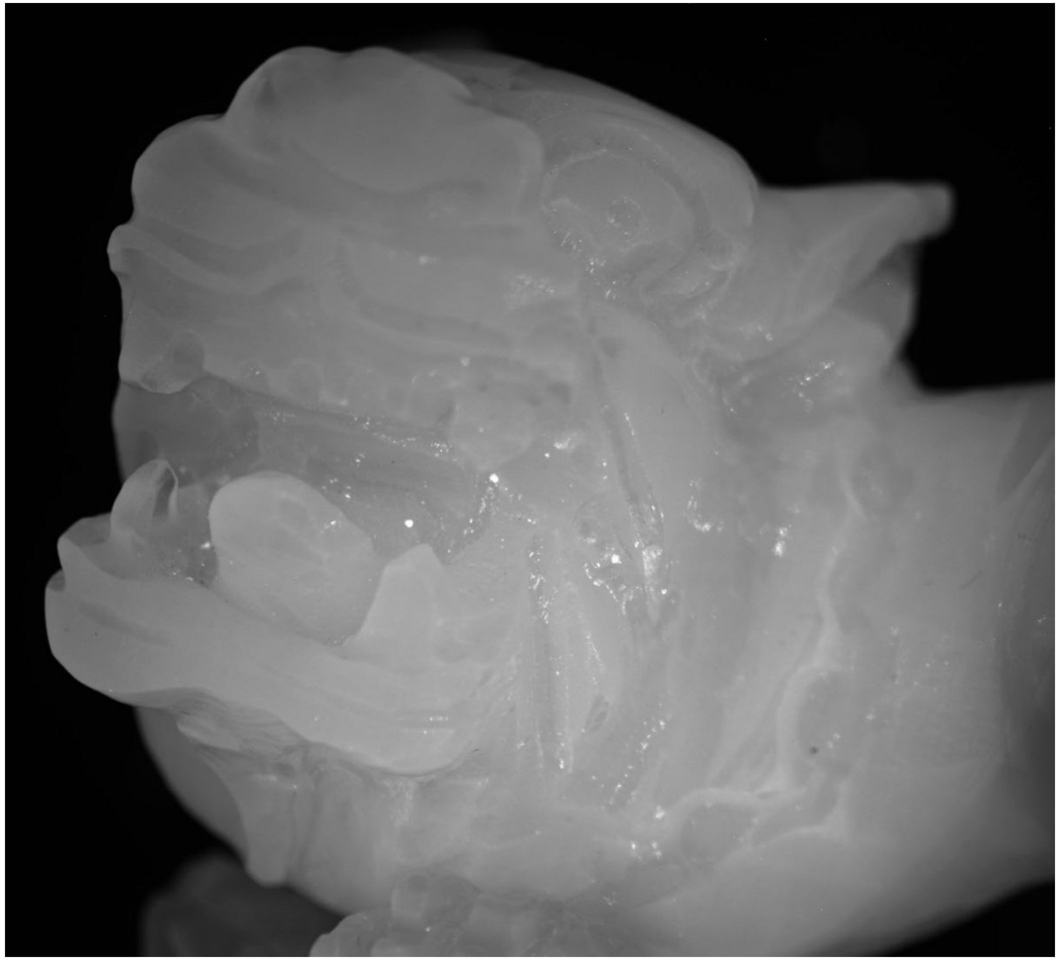
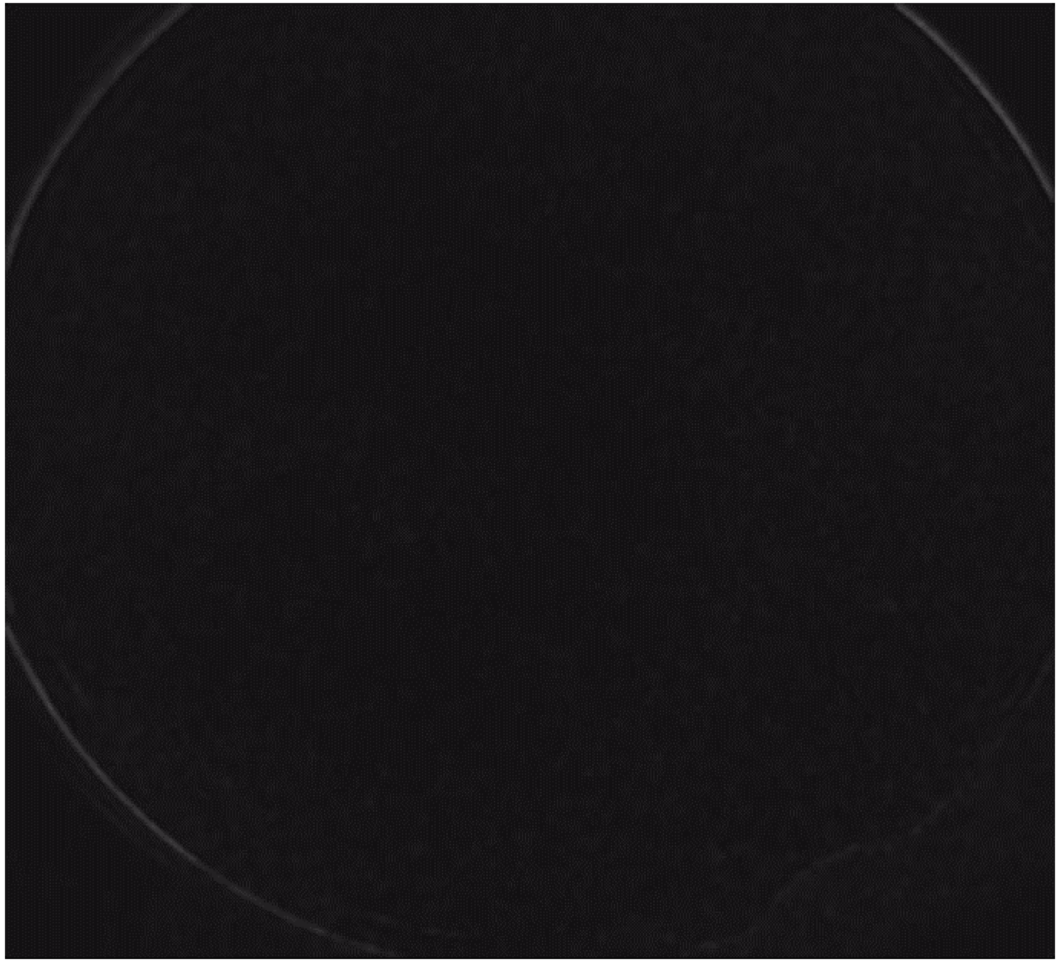
Time-of-flight imaging





15-463, 15-663, 15-862
Computational Photography
Fall 2022, Lecture 17

http://graphics.cs.cmu.edu/courses/15-463

Course announcements

- Homework assignment 6 is due on Sunday, December 12th.
  - Do not leave for last minute, you won’t have time to complete it.

- Final project adjustments.

Overview of today’s lecture

- Introduction to time-of-flight (ToF) imaging.
- Impulse ToF imaging and single-photon avalanche diodes.
- Continuous-wave ToF imaging.
- Interferometric ToF imaging.

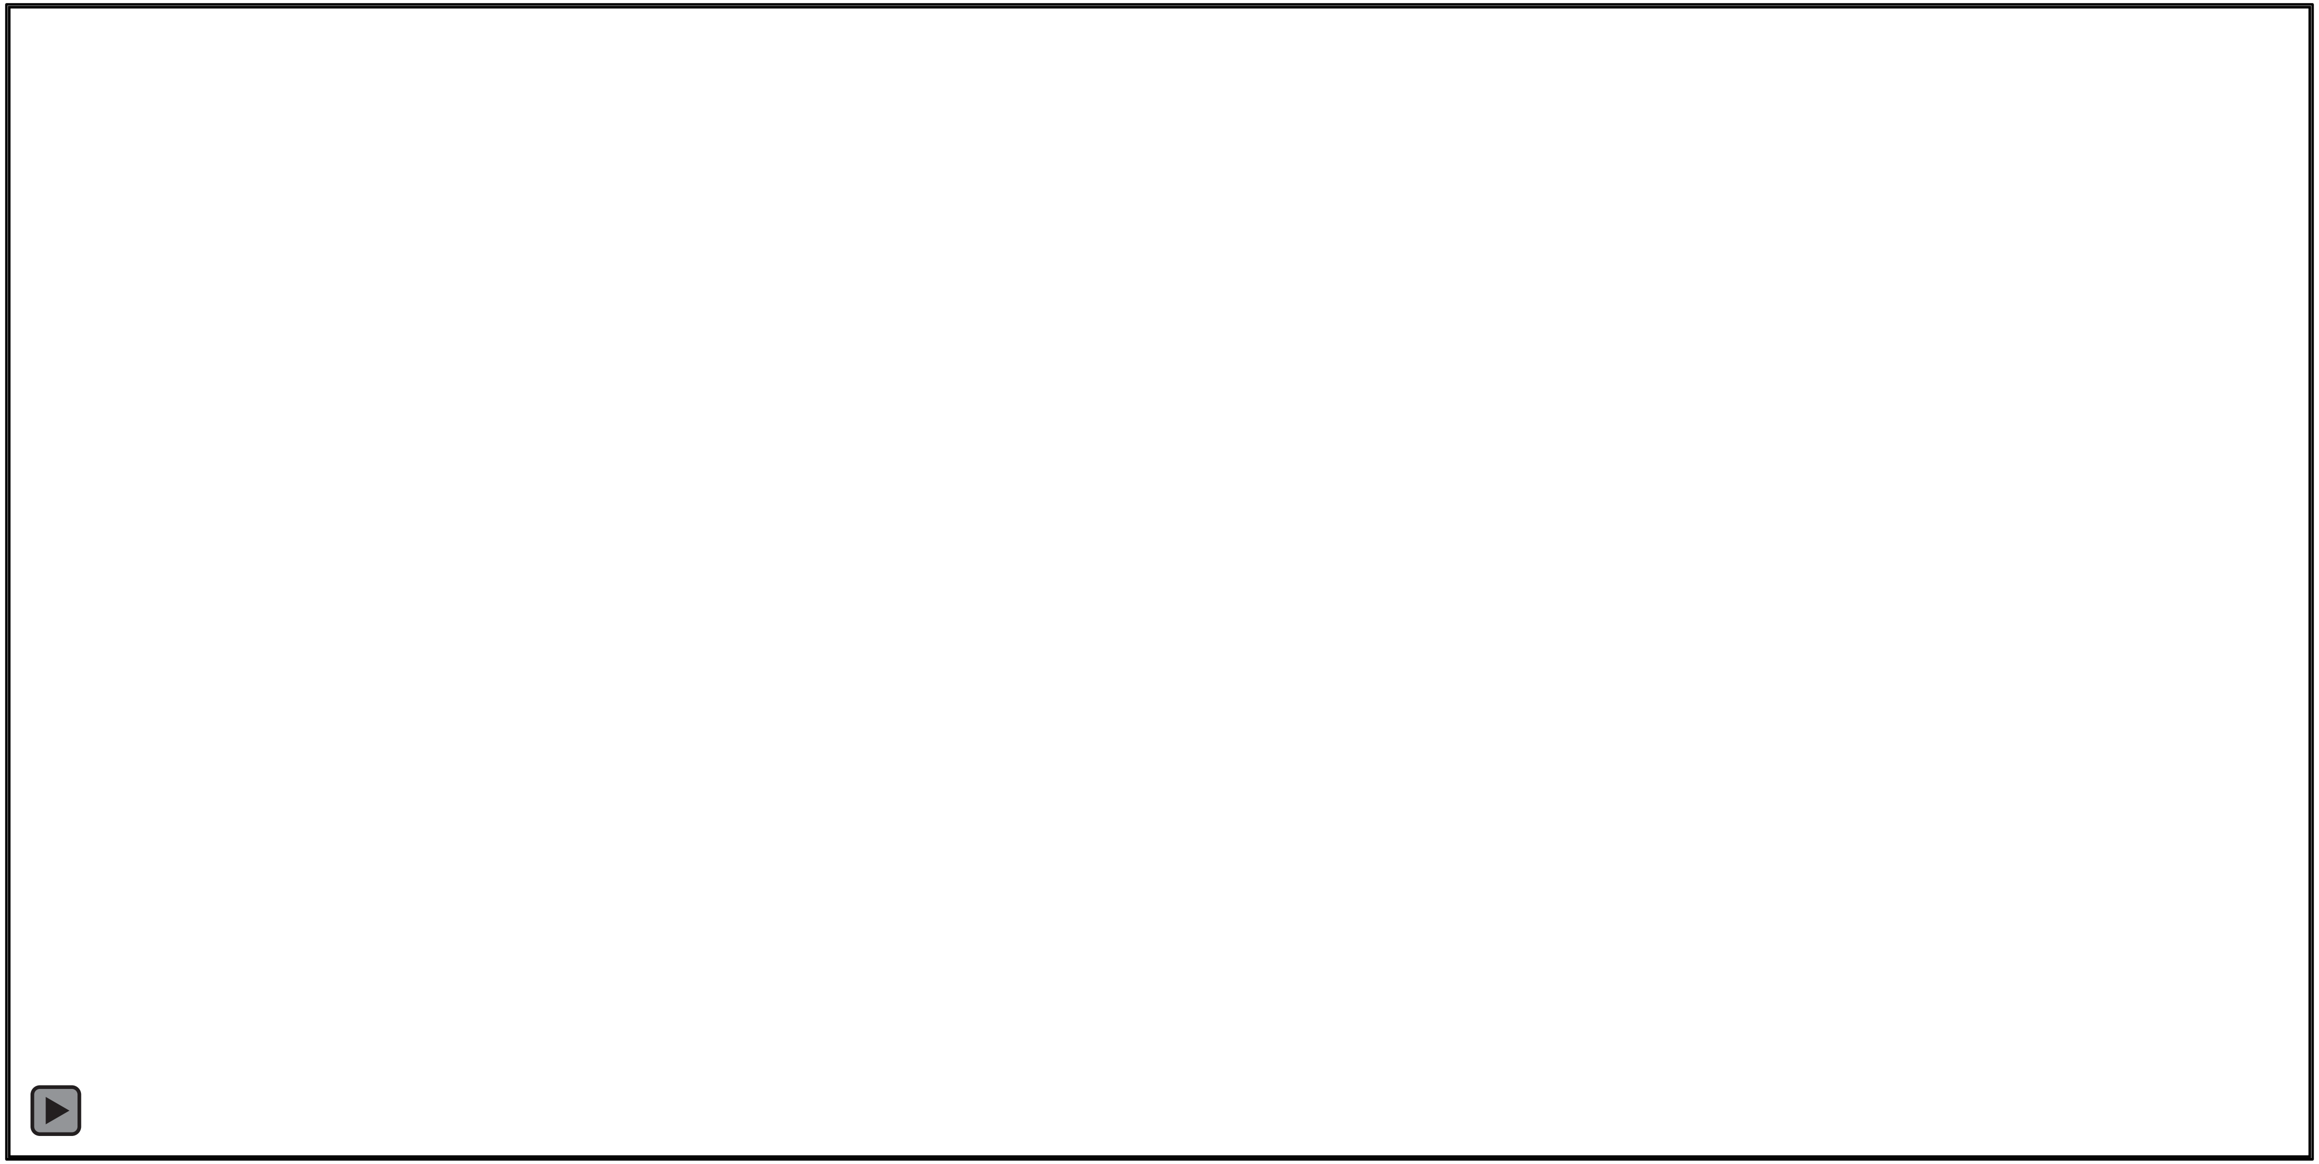
Slide credits

A lot of these slides were adapted from:

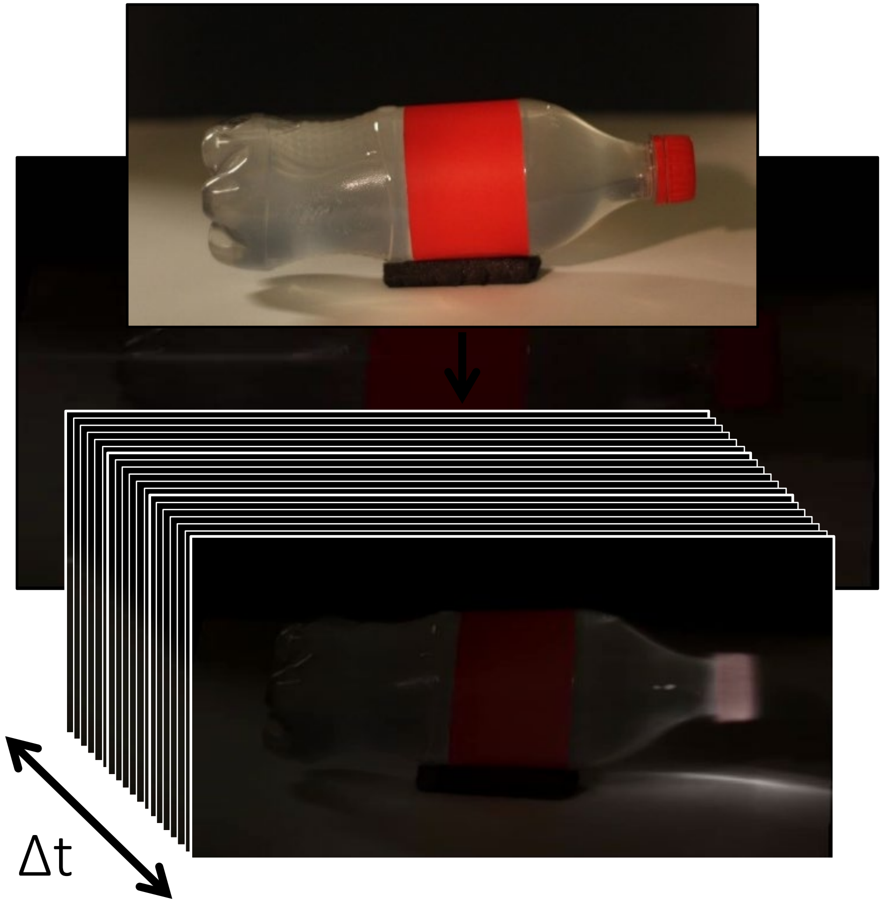
- Mohit Gupta (Wisconsin).
- Supreeth Achar (Google, formerly CMU).

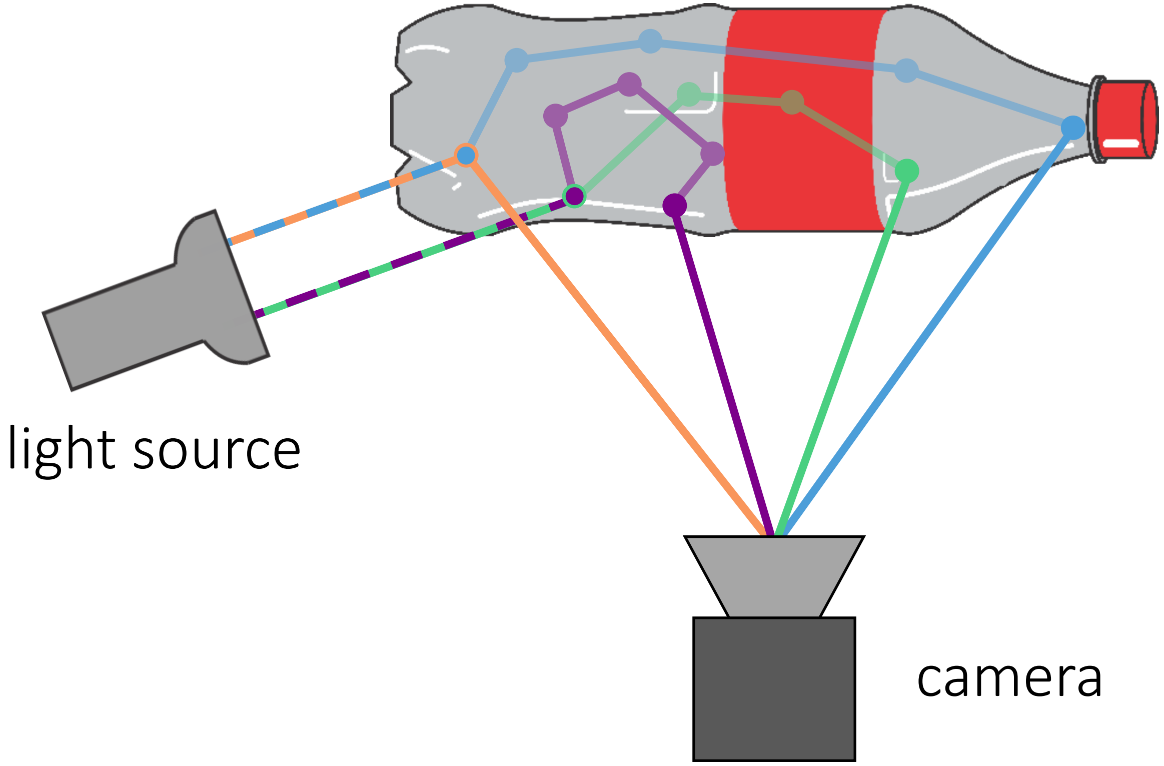
Introduction to time-of-flight (ToF) imaging

Time-of-flight (ToF) imaging



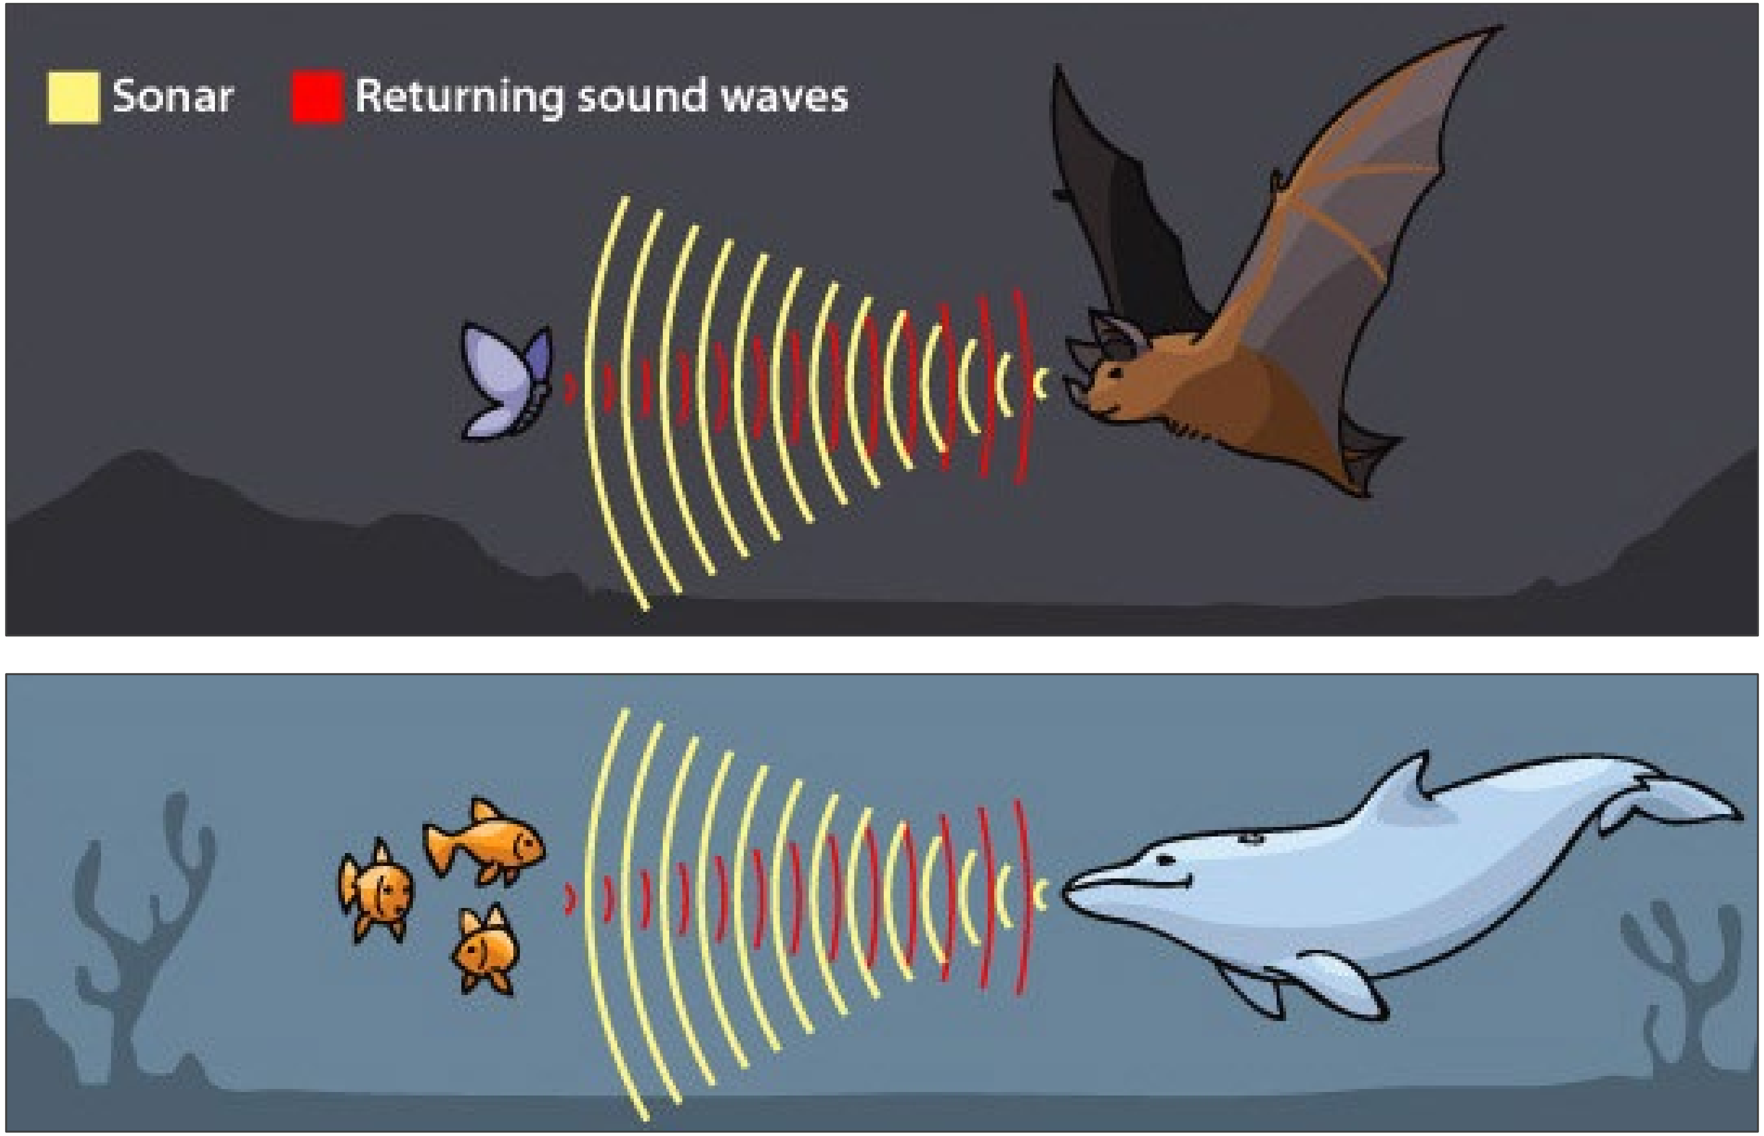
Time-of-flight (ToF) imaging





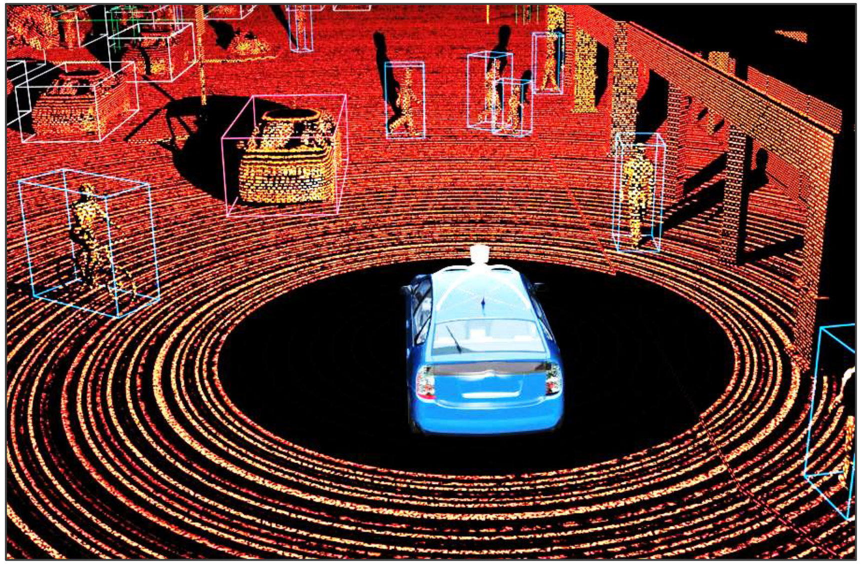
- Conventional imaging: Measure all photons together regardless of time of travel.
- Time-of-flight imaging: Measure photons separately based on time of travel.

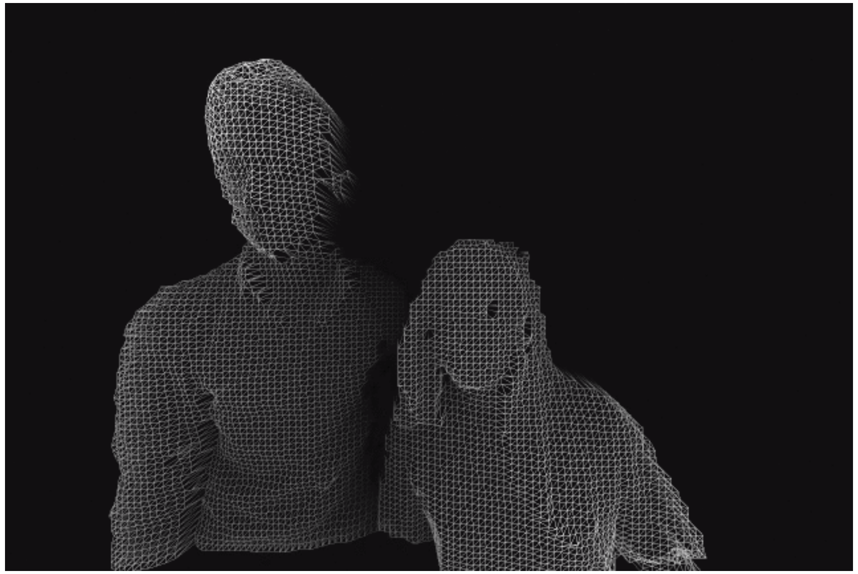
Time-of-flight imaging in nature



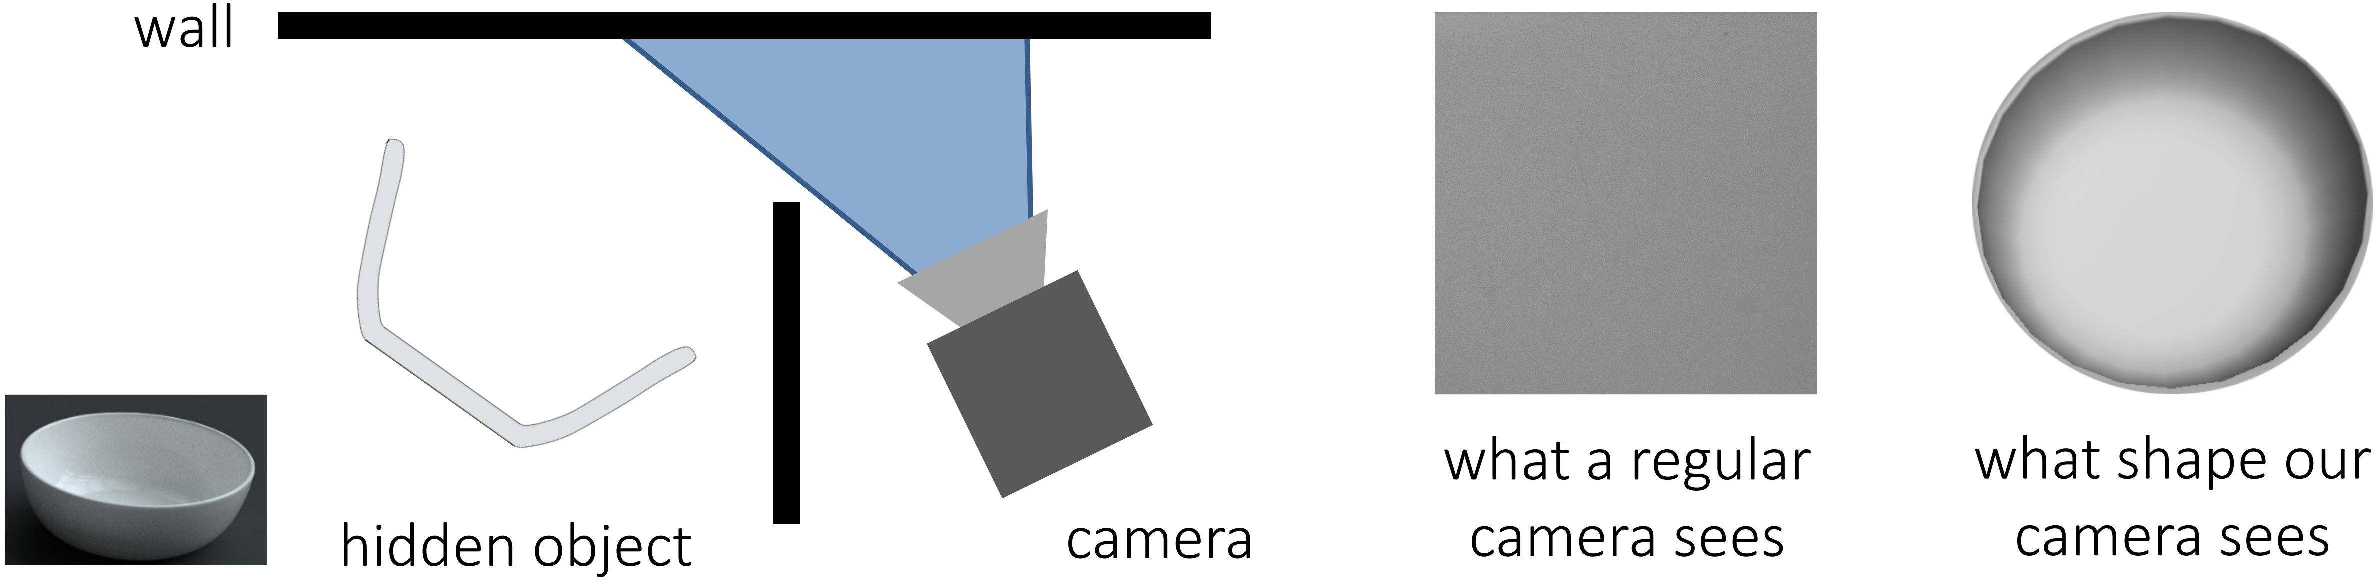
echolocation using sound-wave time-of-flight

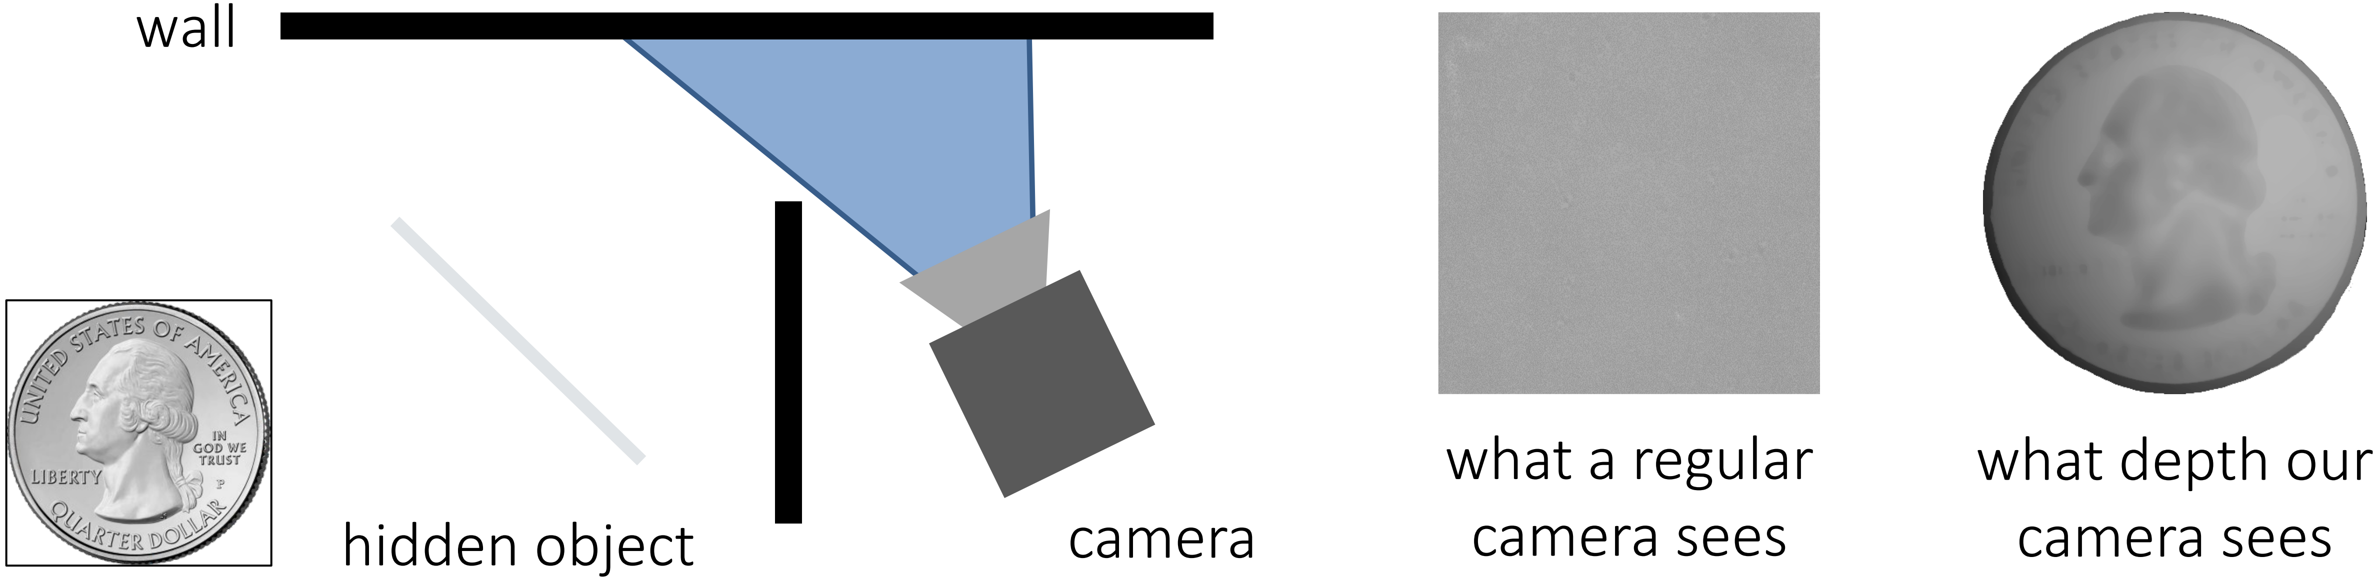
Time-of-flight applications: depth sensing



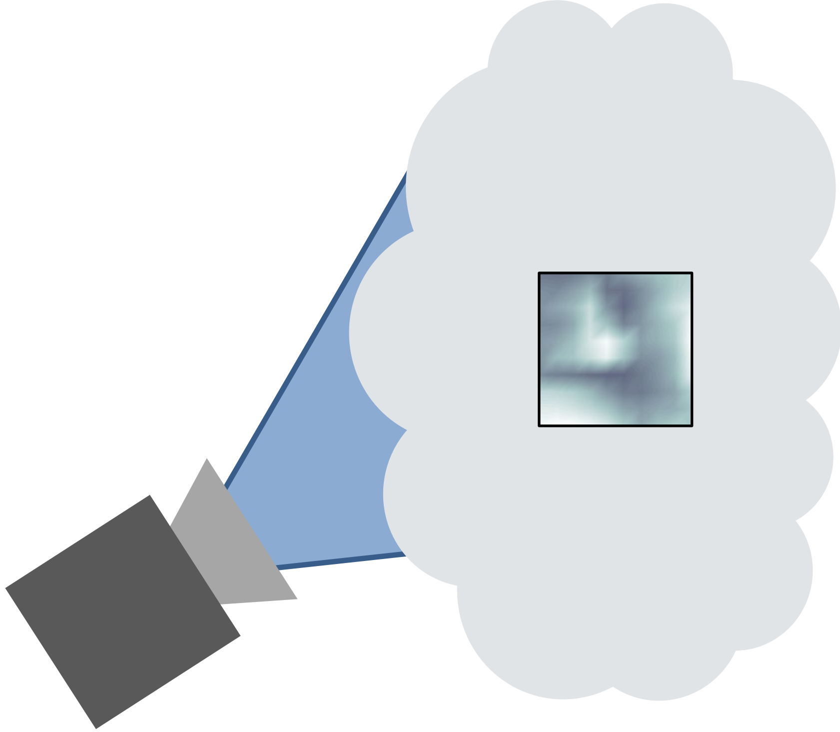


Time-of-flight applications: non-line-of-sight imaging





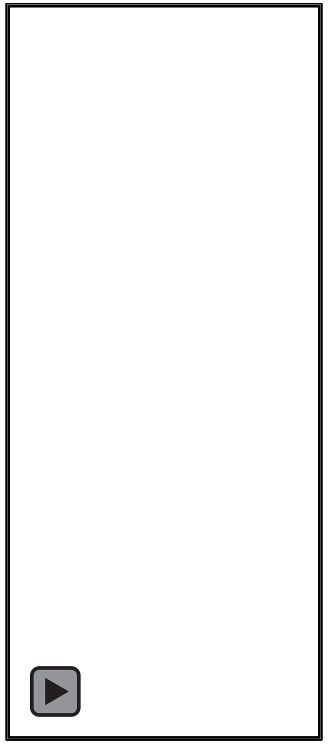
Time-of-flight applications: seeing inside objects



camera

thick smoke cloud

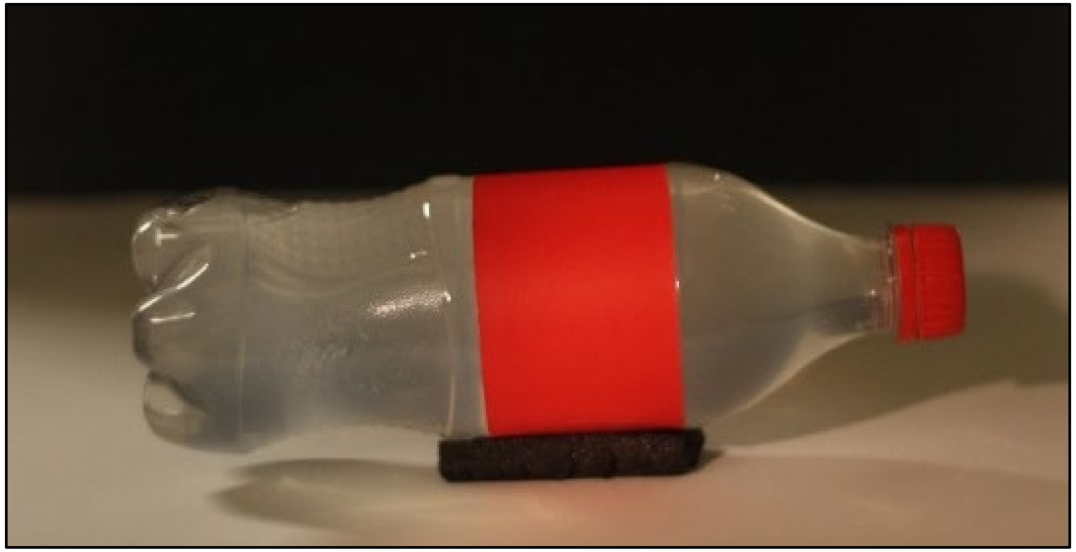
what a regular camera sees



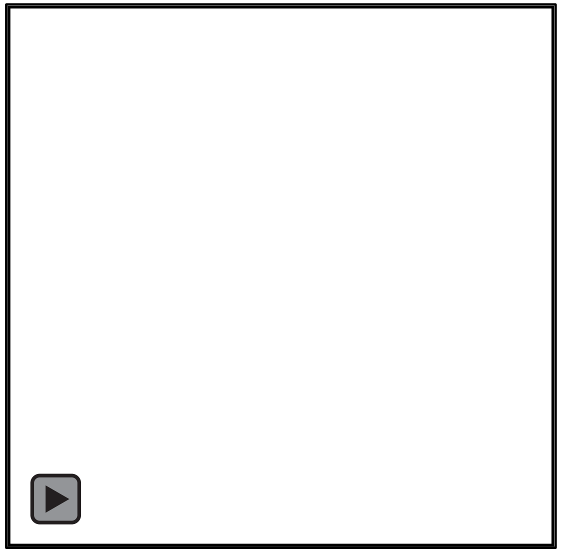
what our camera sees

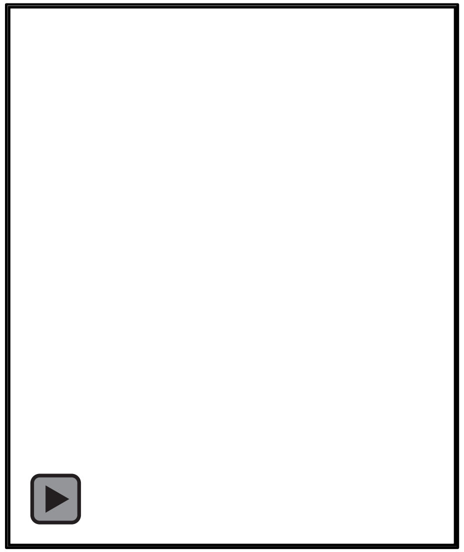
a slice through the cloud

Time-of-flight applications: light-in-flight visualization



video at 10^{12} frames per second





video at 10^{15} frames per second

Time-of-flight imaging technologies

	interferometry	streak cameras	single-photon avalanche diodes	time-of-flight cameras	LIDAR
temporal resolution	1 femtosecond (10^{-15} secs)	1 picosecond (10^{-12} secs)	100 picoseconds (10^{-10} secs)	1 nanosecond (10^{-9} secs)	10 nanoseconds (10^{-8} secs)
frame rate	quadrillion fps	trillion fps	10 billion fps	billion fps	100 million fps
distance travelled	1 micron (10^{-6} meters)	1 millimeter (10^{-3} meters)	10 centimeters (10^{-1} meters)	1 meter (10^{-0} meters)	10 meters (10^{1} meters)

Time-of-flight imaging technologies

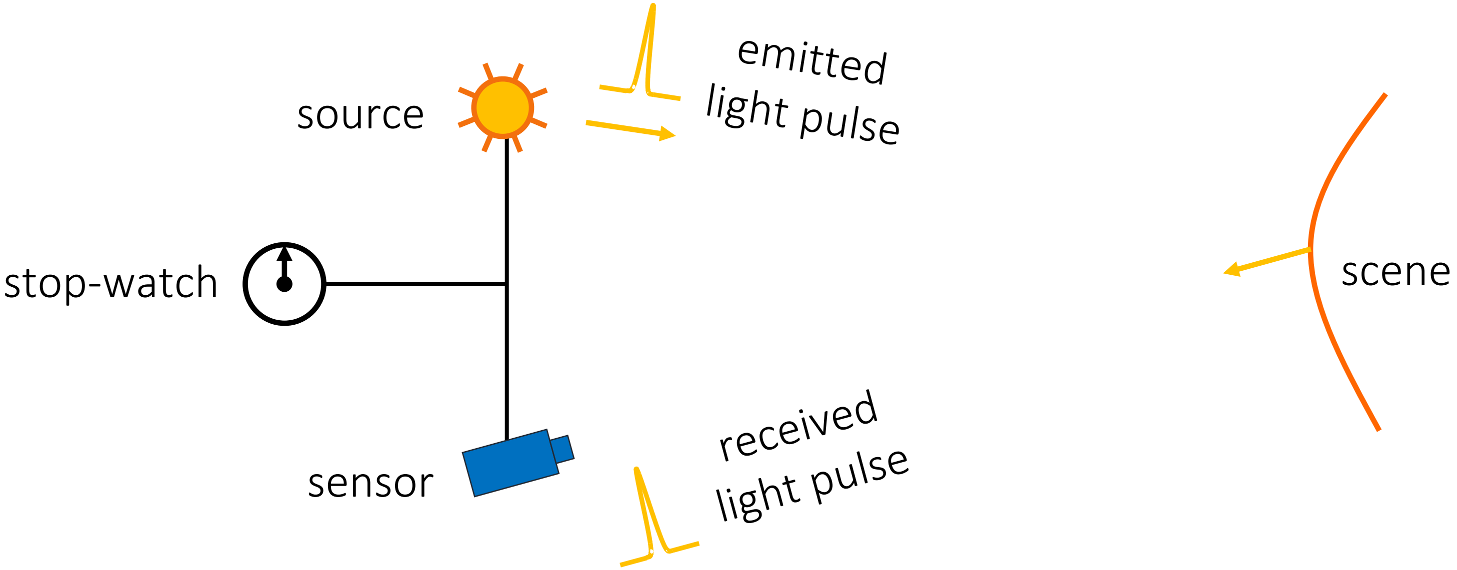
	interferometry	streak cameras	single-photon avalanche diodes	time-of-flight cameras	LIDAR
temporal resolution	1 femtosecond (10^{-15} secs)	1 picosecond (10^{-12} secs)	100 picoseconds (10^{-10} secs)	1 nanosecond (10^{-9} secs)	10 nanoseconds (10^{-8} secs)
frame rate	quadrillion fps	trillion fps	10 billion fps	billion fps	100 million fps
distance travelled	1 micron (10^{-6} meters)	1 millimeter (10^{-3} meters)	10 centimeters (10^{-1} meters)	1 meter (10^{-0} meters)	10 meters (10^{1} meters)

continuous-wave ToF

impulse ToF

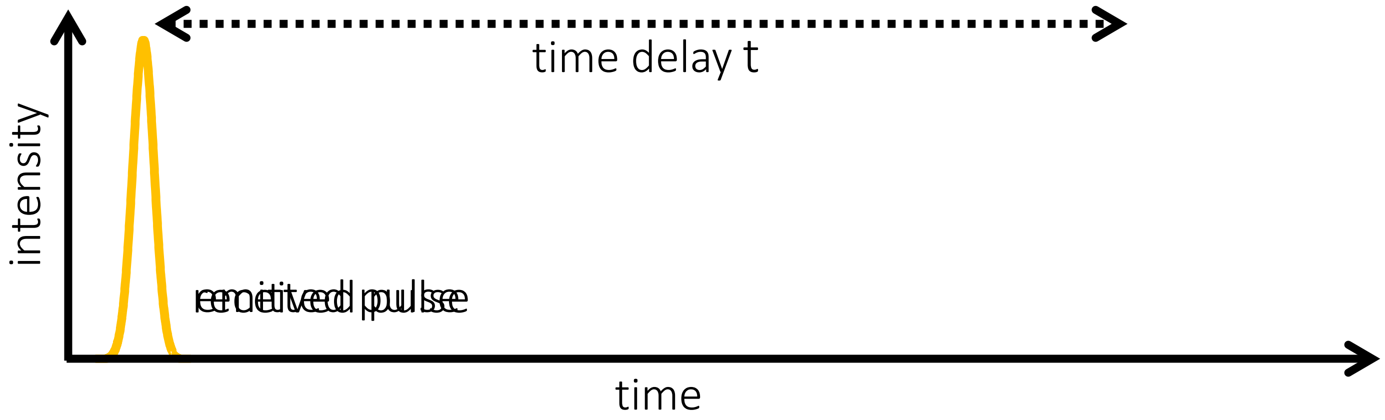
Impulse ToF imaging and single-photon avalanche diodes

Impulse time-of-flight imaging

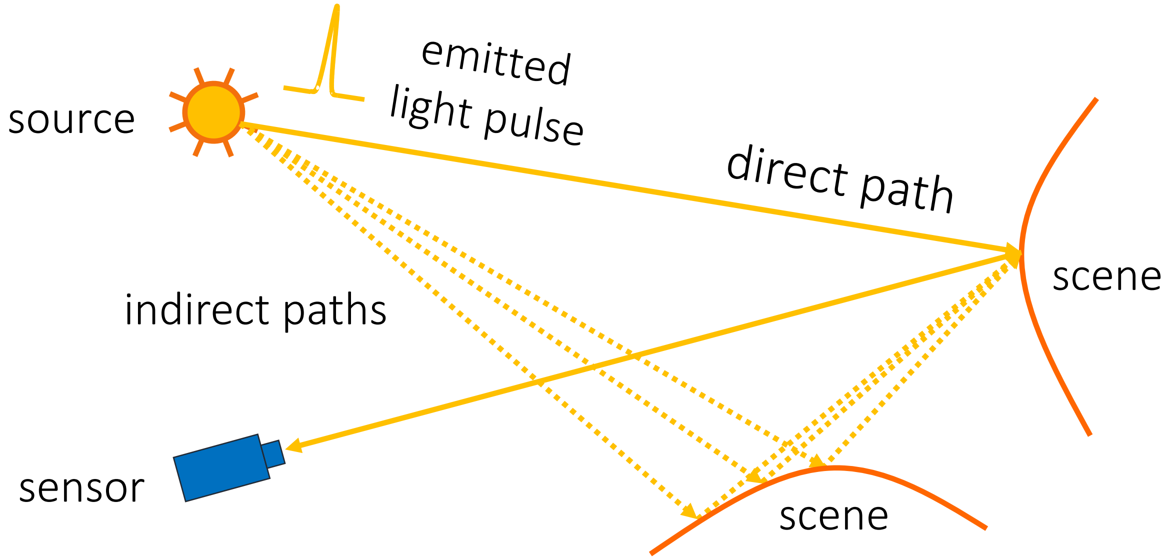


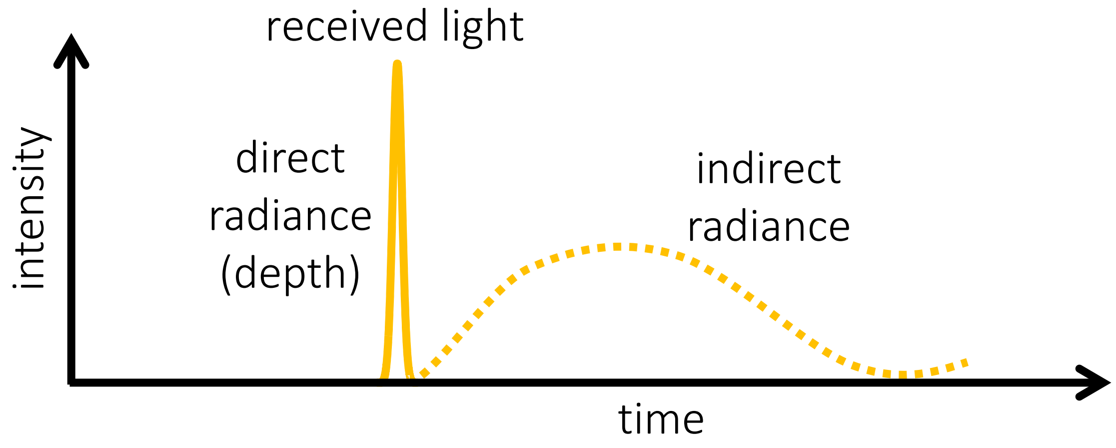
How can we infer depth from this?

$$depth = \frac{t}{2c}$$



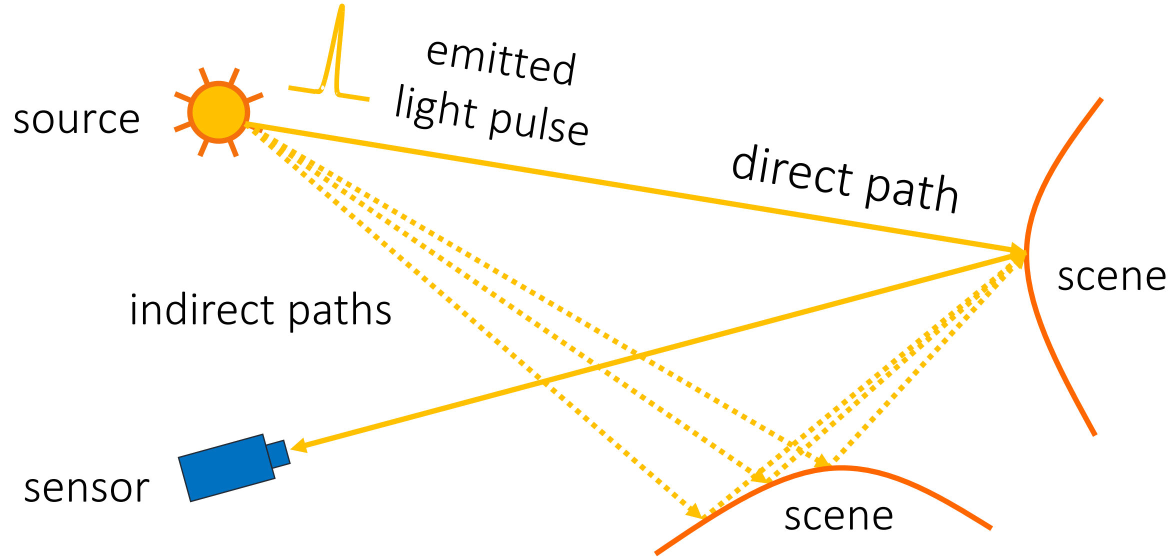
Impulse time-of-flight imaging

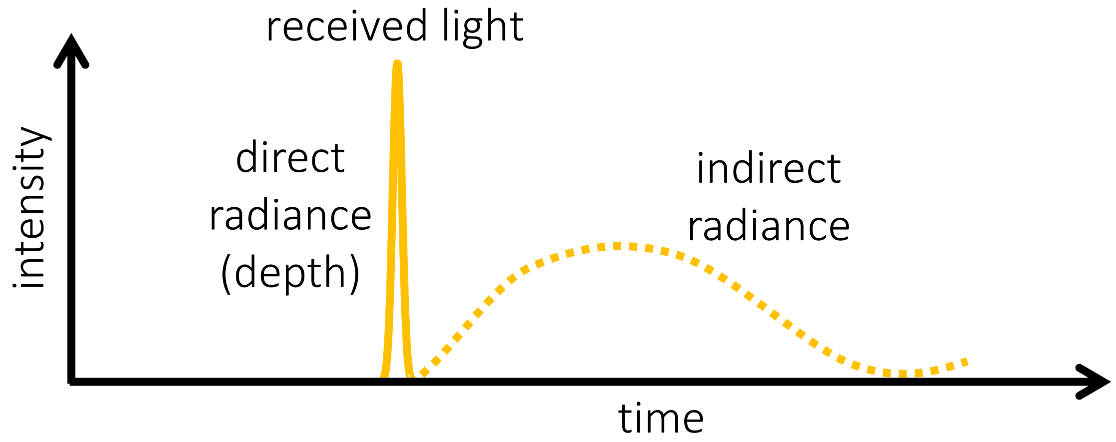




- Indirect paths are nuisance for depth sensing ("multi-path interference").
- Indirect paths are very informative for other time-of-flight applications.

Two types of time-of-flight imaging





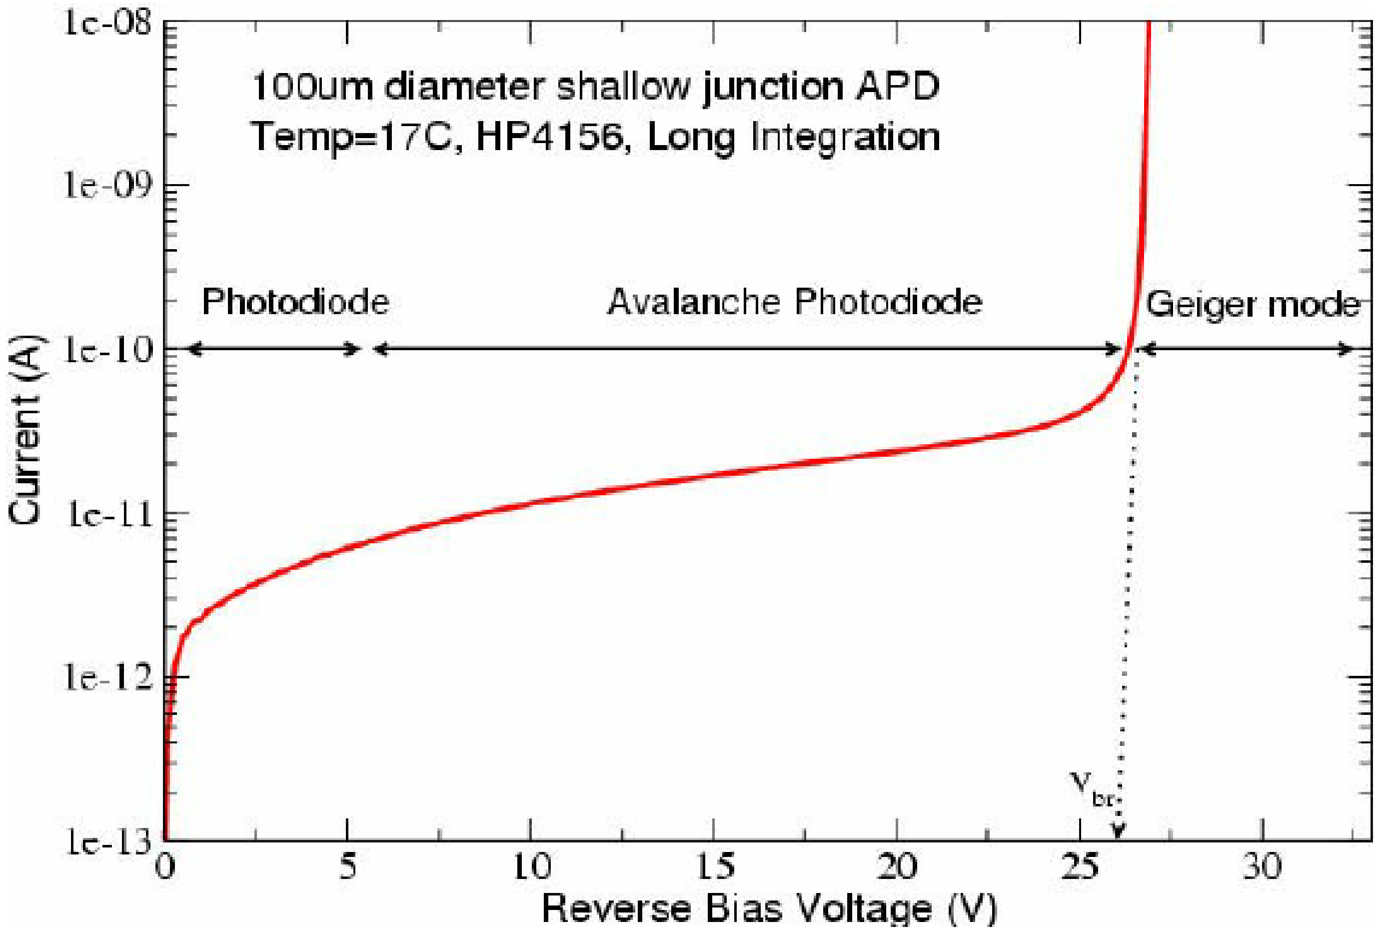
Transient I(t): Time-resolved radiance distribution

- Range imaging: Measuring only first returning photons (e.g., LIDAR).
- Transient imaging: Measuring entire transient (e.g., SPAD).

How exactly is the transient formed?

Depends on the kind of sensor we use.

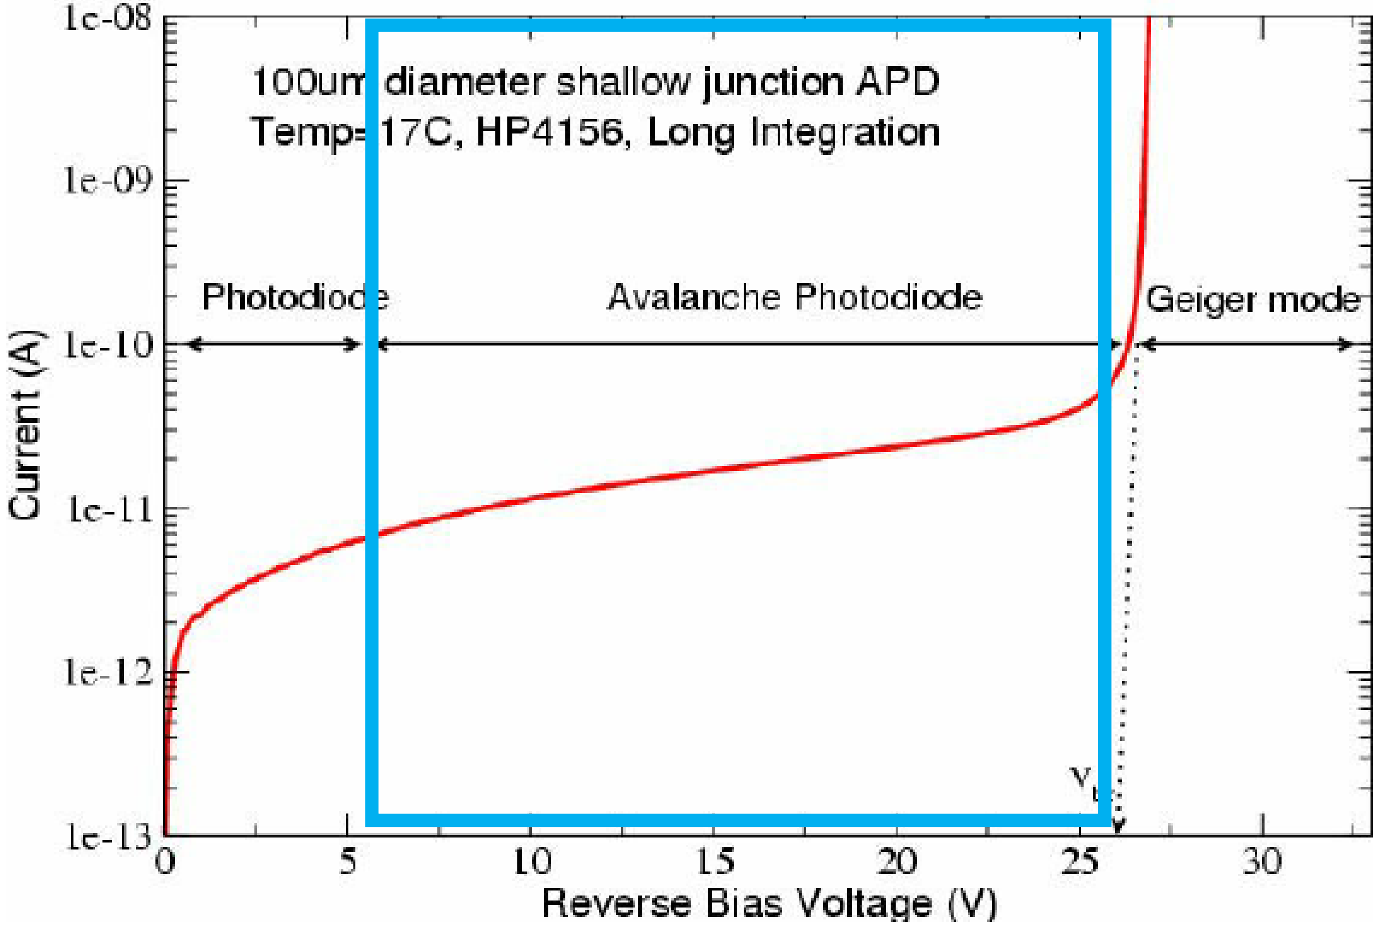
- Here we will examine only photodiodes.



How exactly is the transient formed?

Depends on the kind of sensor we use.

- Here we will examine only photodiodes.



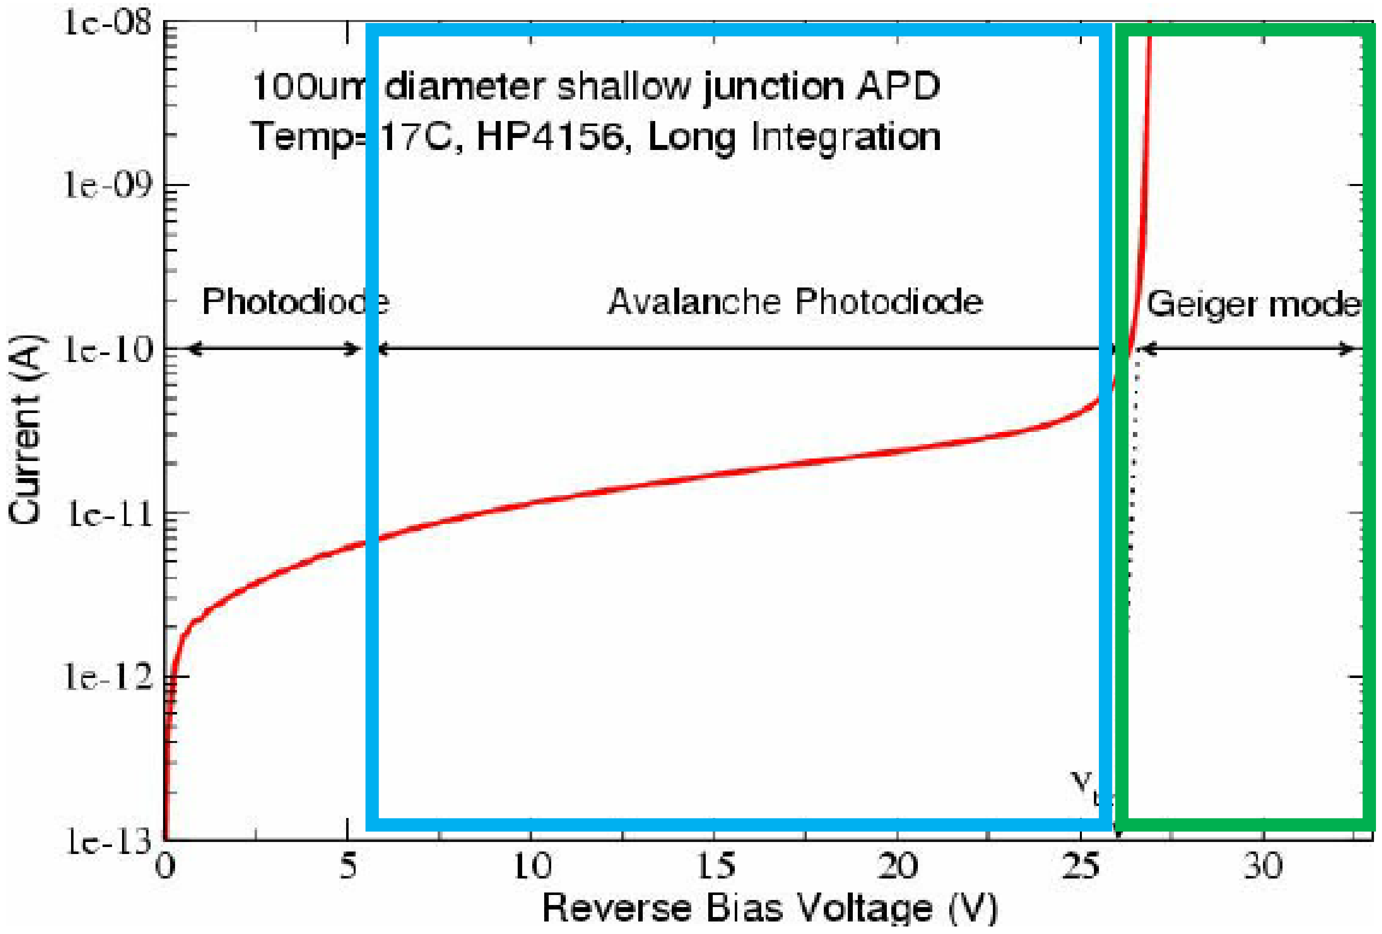
Avalanche photodiode (APD):

- Current is roughly proportional to number of photons.
- One photon produces tiny current.

How exactly is the transient formed?

Depends on the kind of sensor we use.

- Here we will examine only photodiodes.



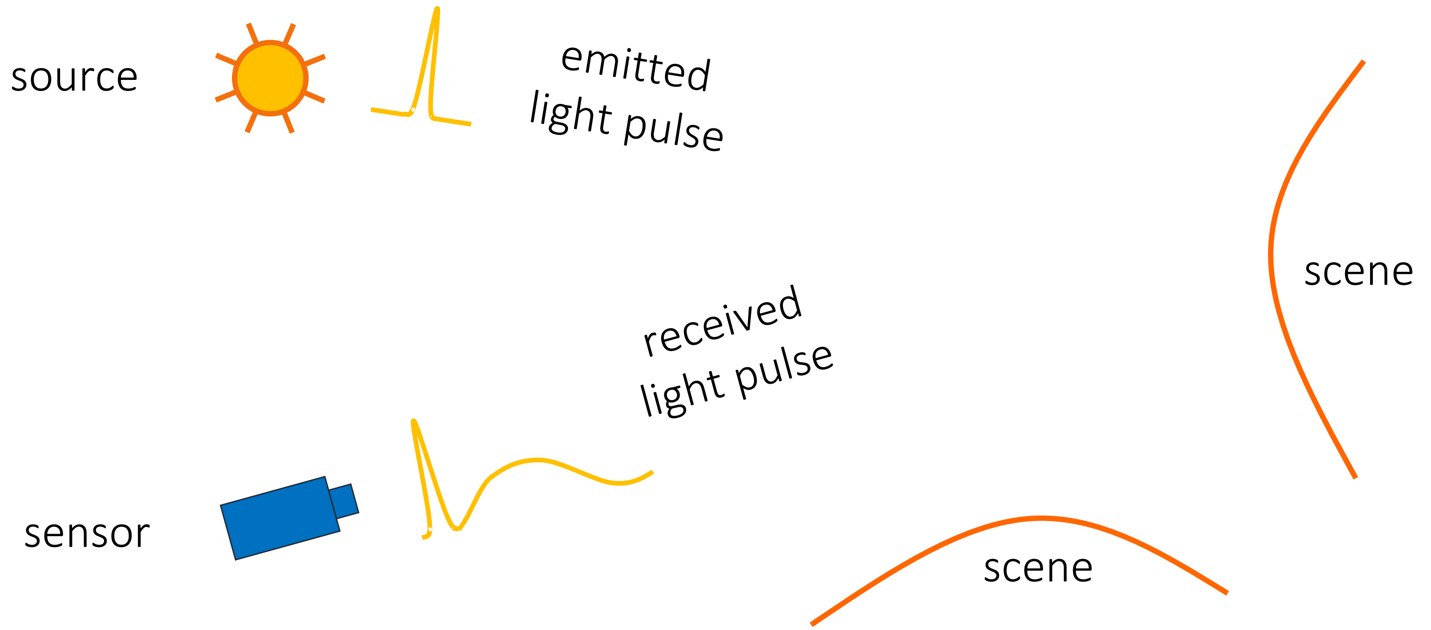
<u>Avalanche photodiode (APD)</u>:

- Current is roughly proportional to number of photons.
- One photon produces tiny current.

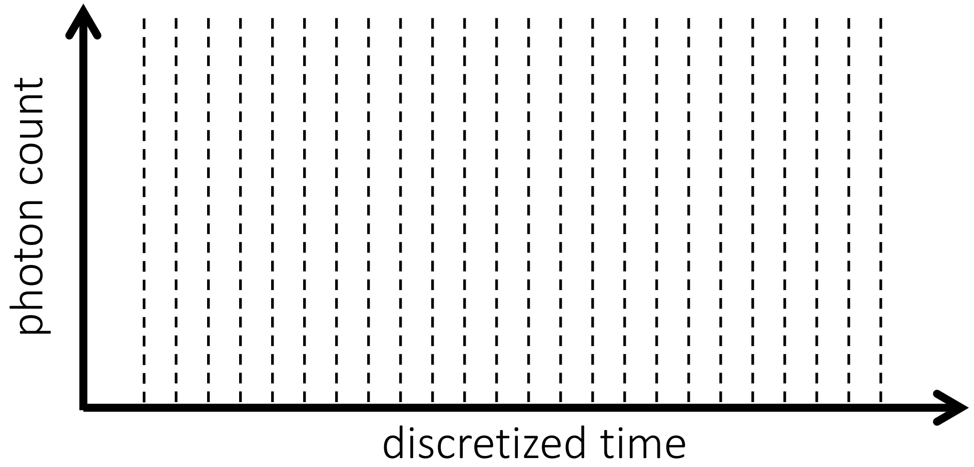
<u>Single-photon avalanche diode (SPAD)</u>:

- One photon produces huge current.
- Requires multiple <u>low power</u> pulses, so that one photon returns from each.

Geiger-mode impulse time-of-flight imaging



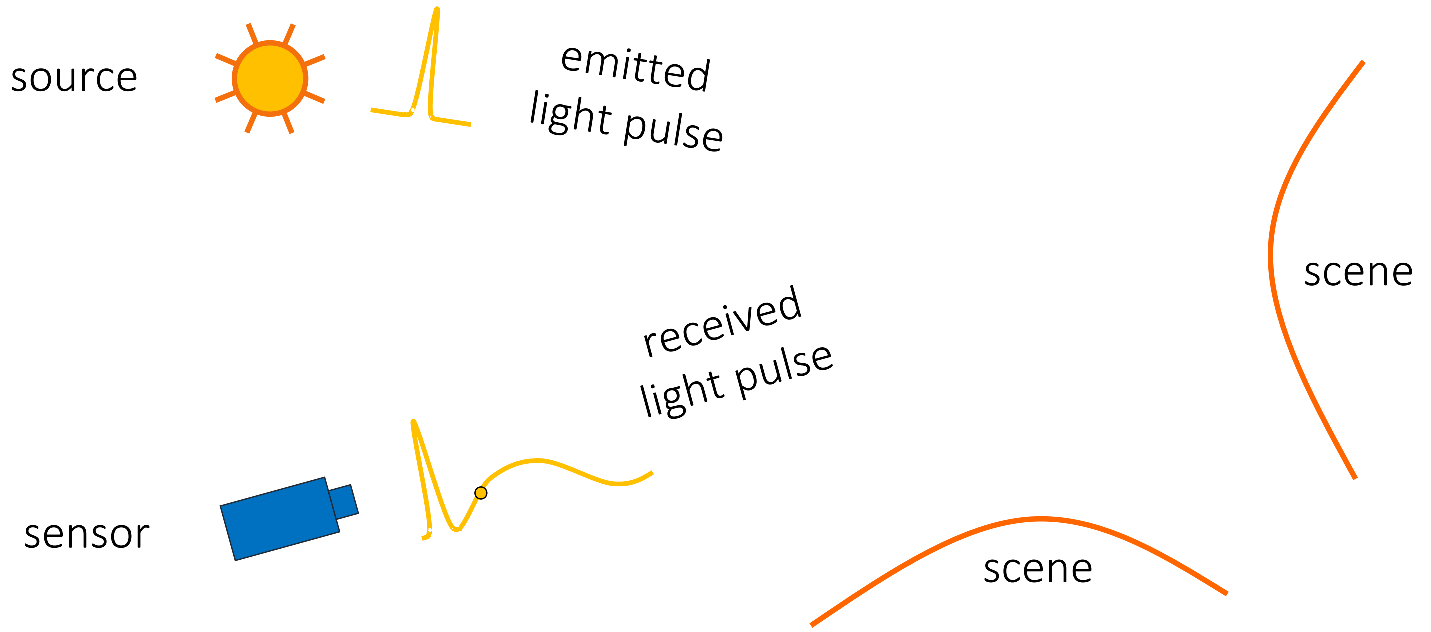
From each received pulse, one photon saturates the SPAD.

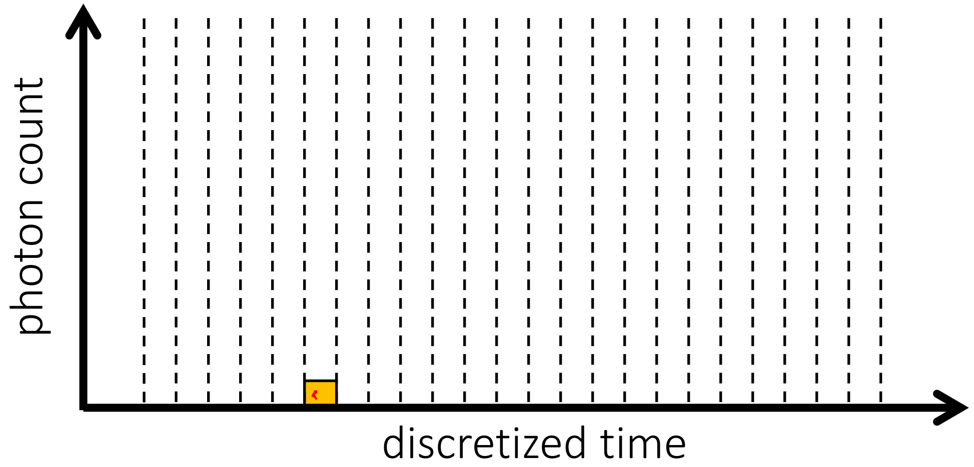


- The SPAD records only photon arrival times, no intensity.
- Additional electronics maintain a histogram of arrival times over multiple pulses

Geiger-mode impulse time-of-flight imaging

From each received pulse, one photon saturates the SPAD.

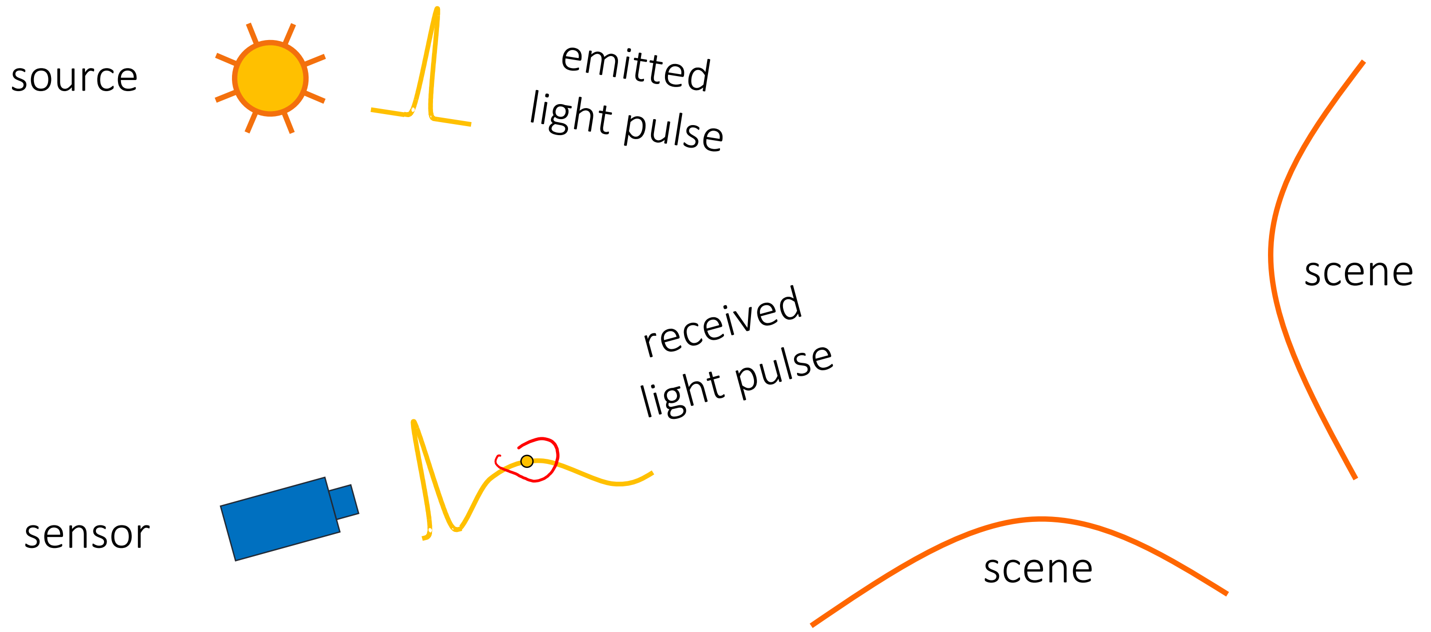


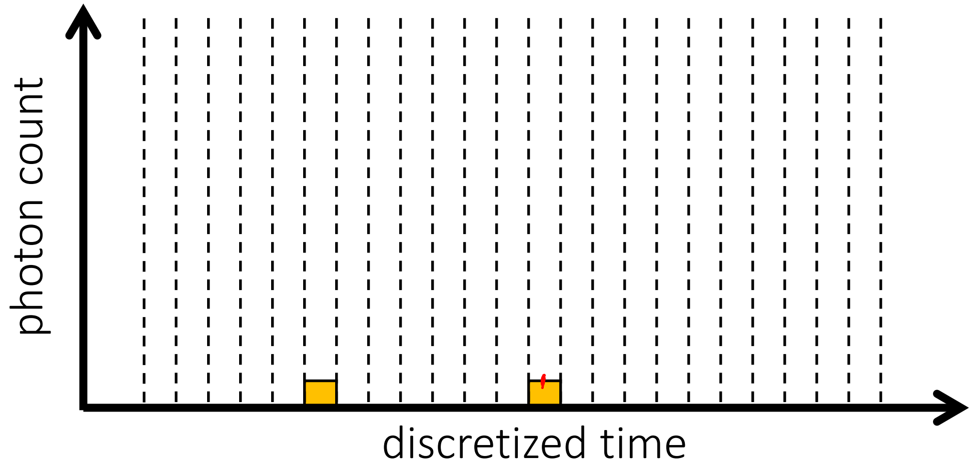


- The SPAD records only photon arrival times, no intensity.
- Additional electronics maintain a histogram of arrival times over multiple pulses

Geiger-mode impulse time-of-flight imaging

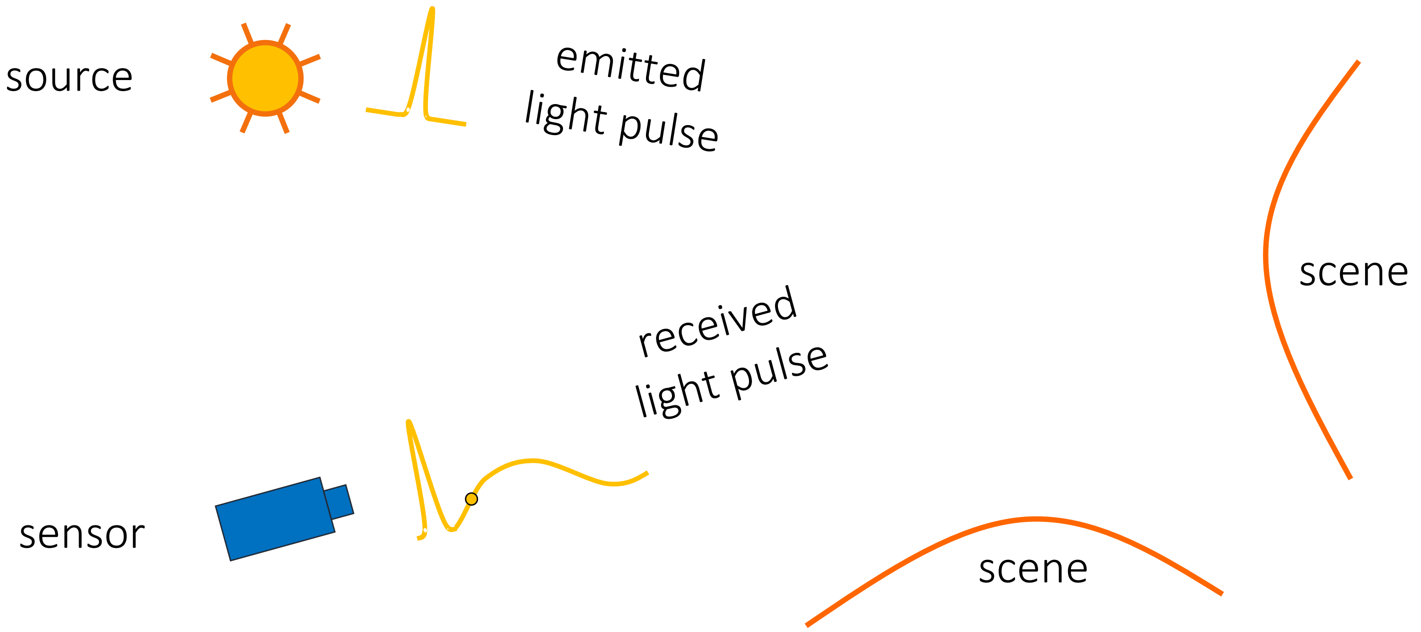
From each received pulse, one photon saturates the SPAD.



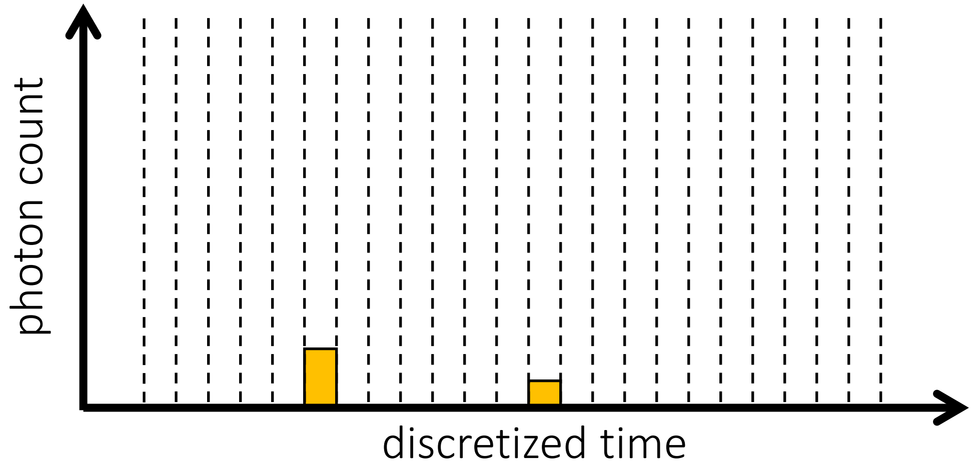


- The SPAD records only photon arrival times, no intensity.
- Additional electronics maintain a histogram of arrival times over multiple pulses

Geiger-mode impulse time-of-flight imaging



From each received pulse, one photon saturates the SPAD.

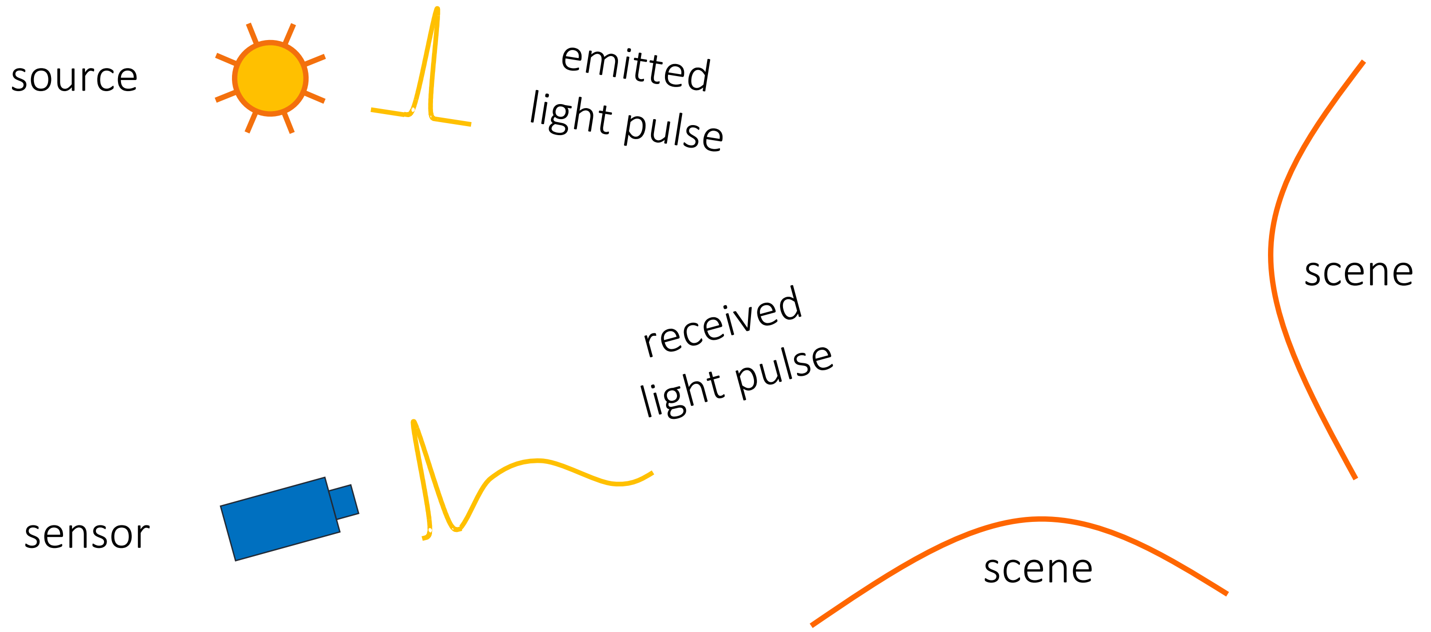


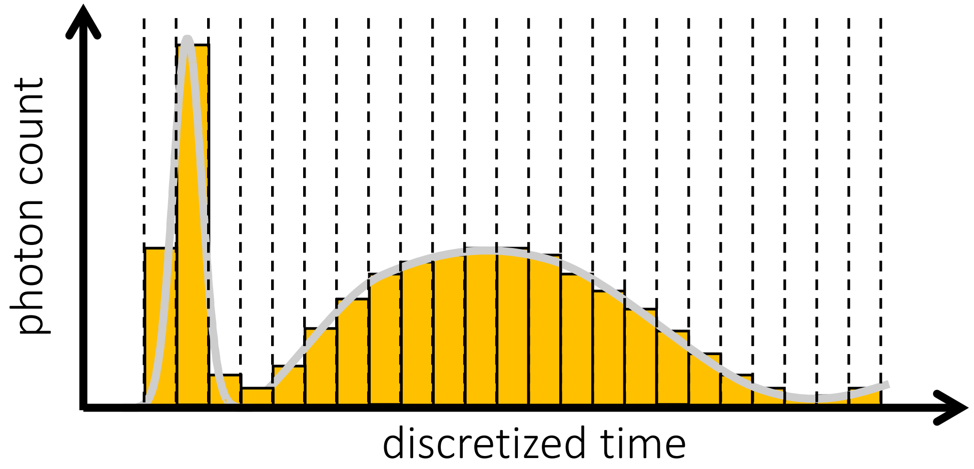
- The SPAD records only photon arrival times, no intensity.
- Additional electronics maintain a histogram of arrival times over multiple pulses

Geiger-mode impulse time-of-flight imaging

From each received pulse, one photon saturates the SPAD.

What determines which photon gets picked?



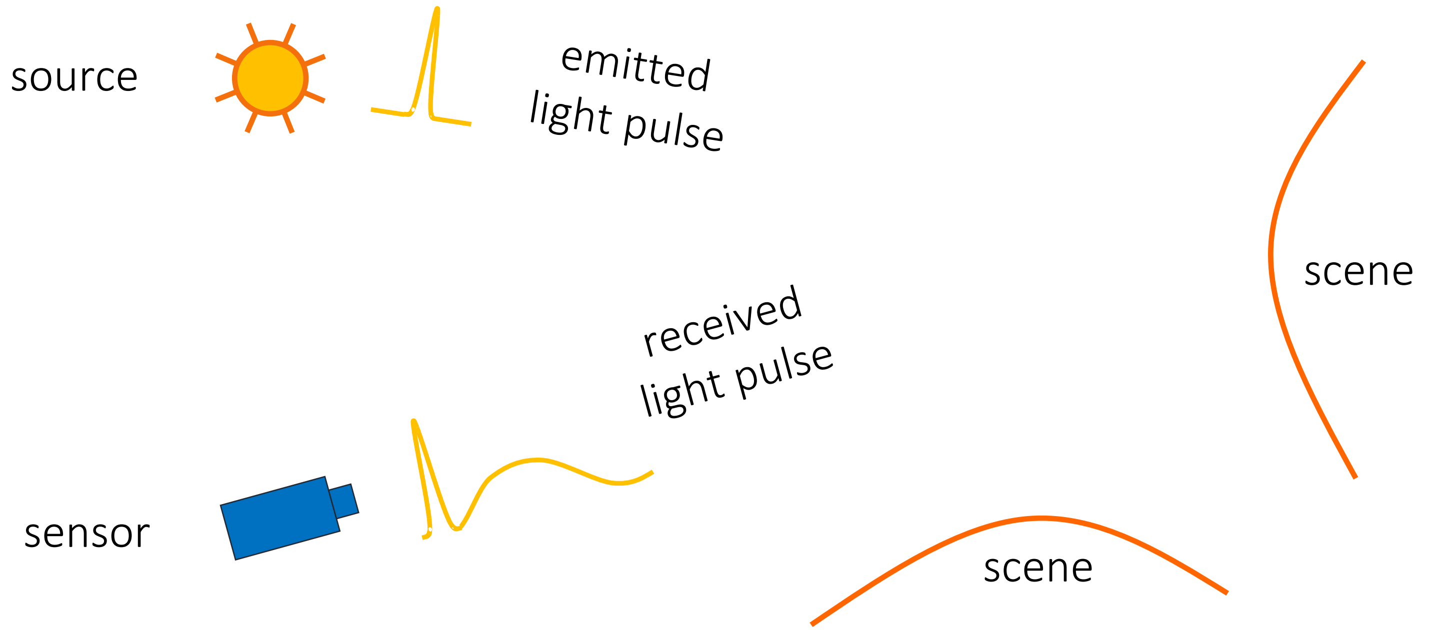


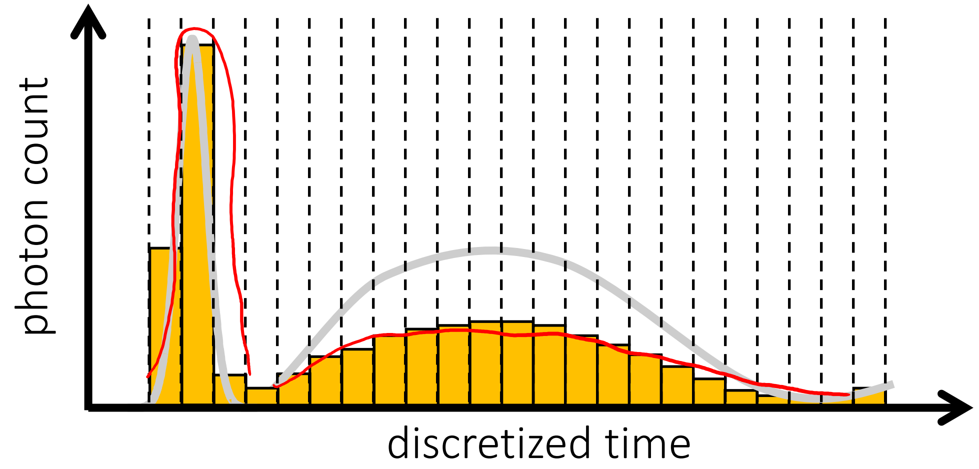
- The SPAD records only photon arrival times, no intensity.
- Additional electronics maintain a histogram of arrival times over multiple pulses

Geiger-mode impulse time-of-flight imaging

From each received pulse, one photon saturates the SPAD.

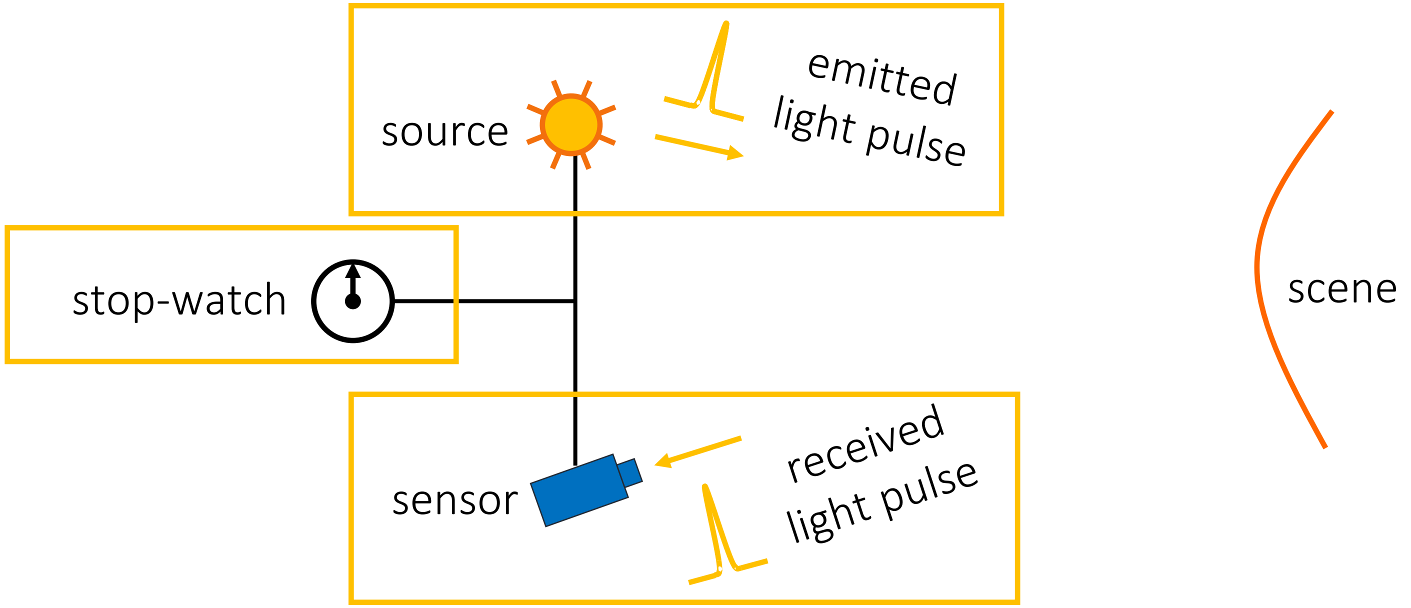
What determines which photon gets picked?





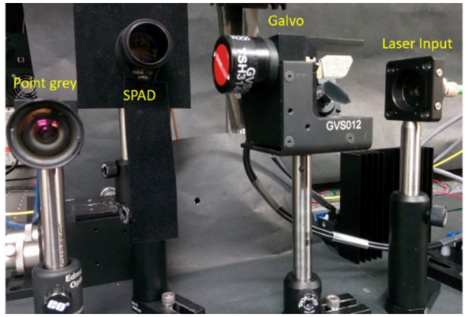
- Photons earlier in the transient have a higher probability of being detected than photons later in the transient.
- As a result, histogram of photon detections underestimates later parts of the transient.
- This effect is called *pile-up* and is very severe under strong light conditions.

What hardware do we need for impulse ToF?



Expensive lasers
[short (picosecond) and powerful
(mega joules) light pulses]

High speed and high
dynamic range sensors
[single-photon sensitivity]



Expensive syncing and
photon-counting electronics
[picosecond time resolution]

Time-of-flight imaging technologies

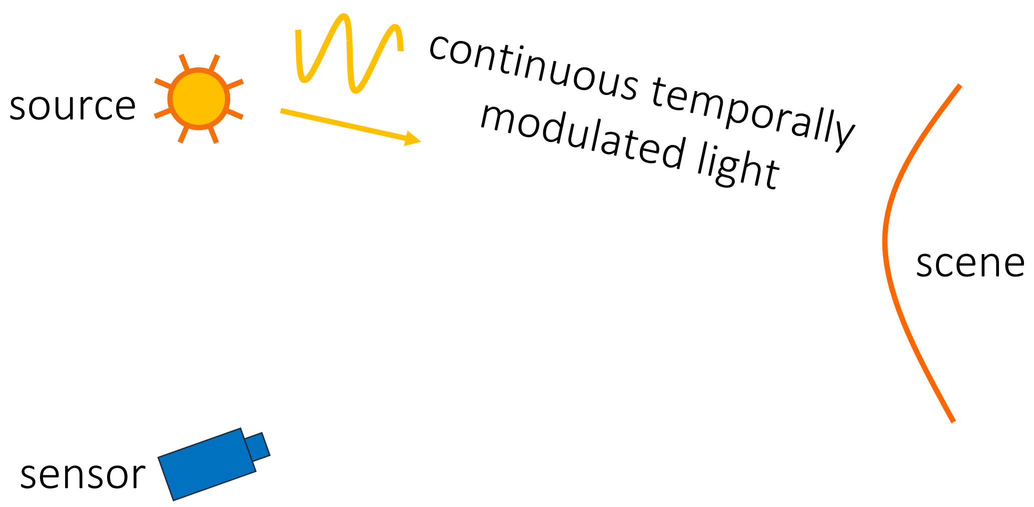
	interferometry	streak cameras	single-photon avalanche diodes	time-of-flight cameras	LIDAR
temporal resolution	1 femtosecond (10^{-15} secs)	1 picosecond (10^{-12} secs)	100 picoseconds (10^{-10} secs)	1 nanosecond (10^{-9} secs)	10 nanoseconds (10^{-8} secs)
frame rate	quadrillion fps	trillion fps	10 billion fps	billion fps	100 million fps
distance travelled	1 micron (10^{-6} meters)	1 millimeter (10^{-3} meters)	10 centimeters (10^{-1} meters)	1 meter (10^{-0} meters)	10 meters (10^{1} meters)

continuous-wave ToF: interferometry, time-of-flight cameras

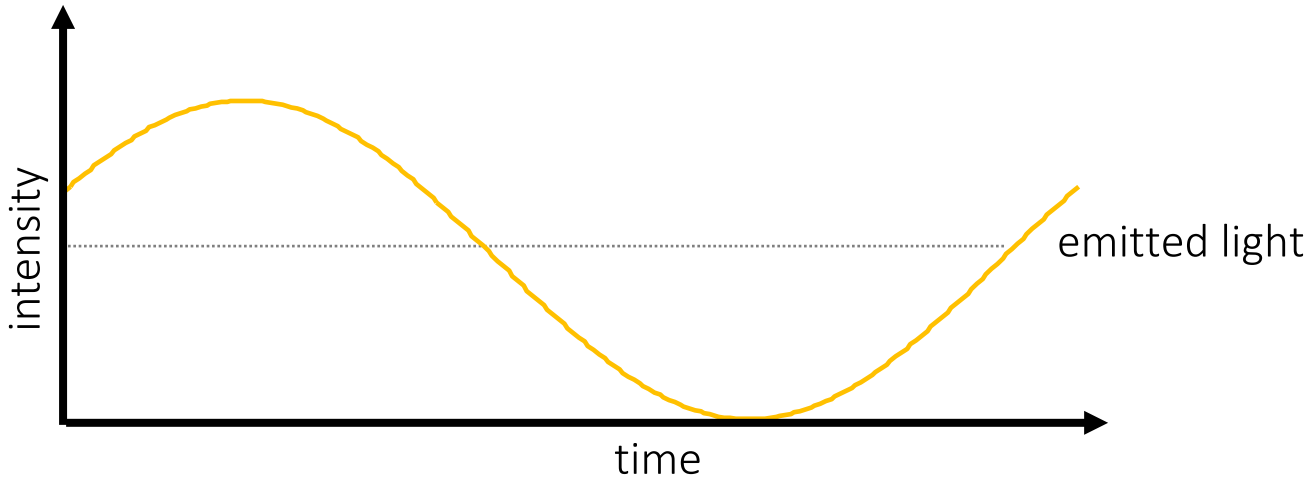
impulse ToF: streak cameras, single-photon avalanche diodes, LIDAR

Continuous-wave ToF imaging

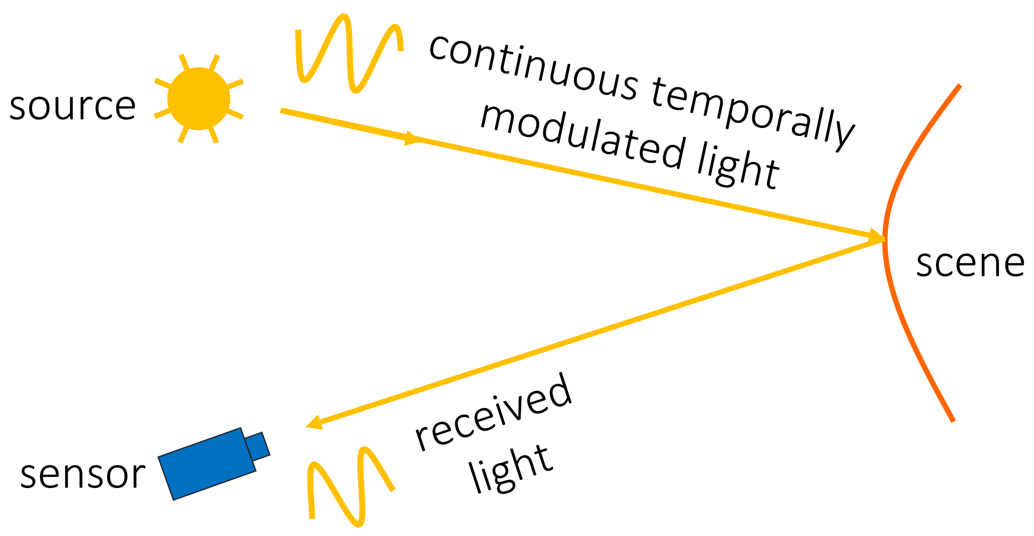
Continuous-wave (CW) time-of-flight imaging

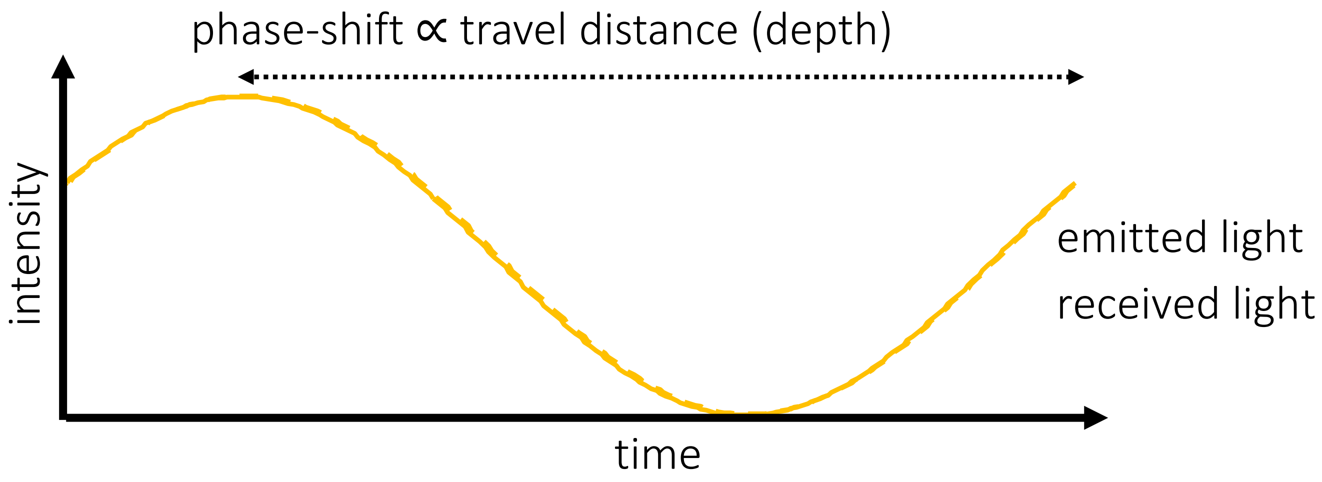


sinusoid

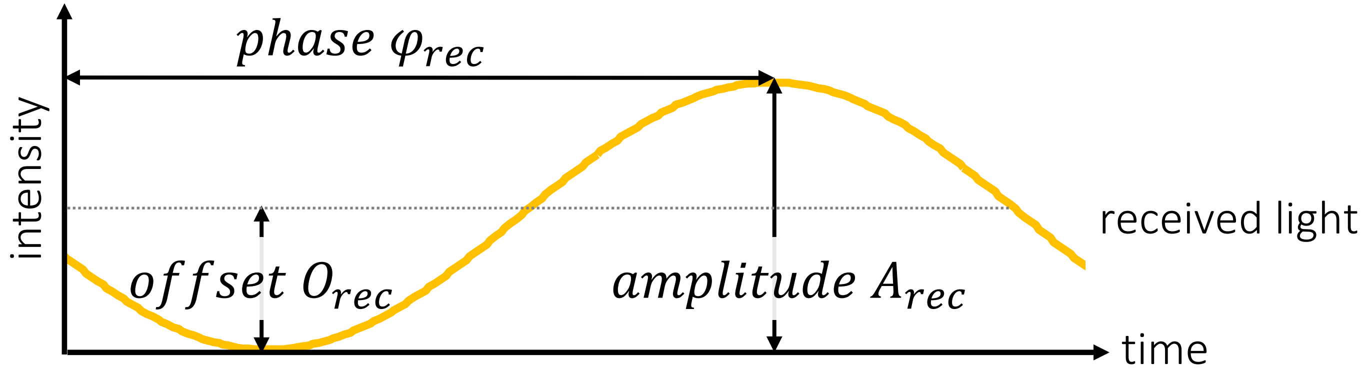


Continuous-wave (CW) time-of-flight imaging





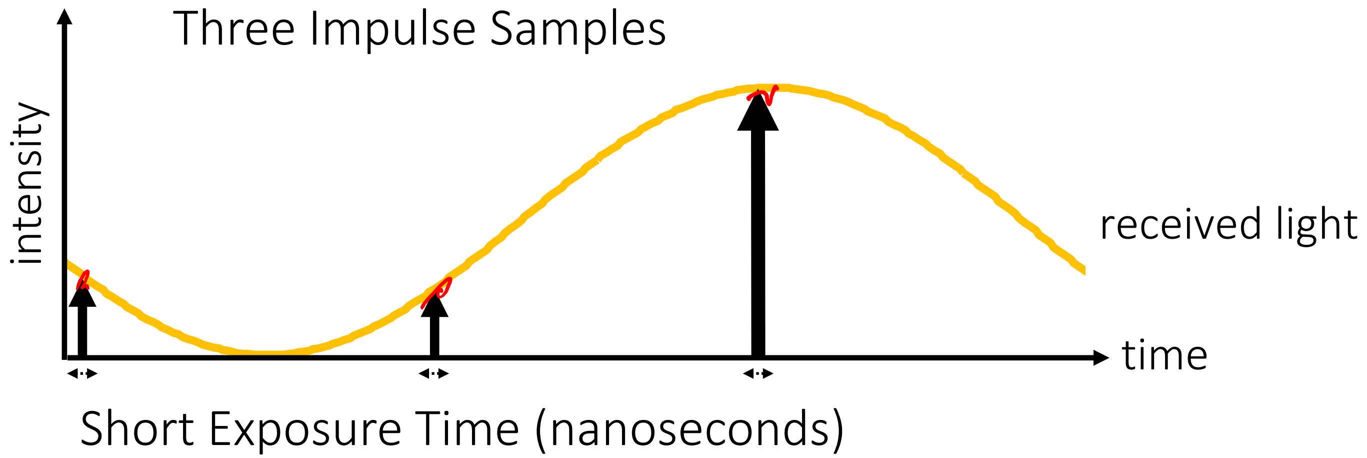
Measuring phase shift



Three Unknowns

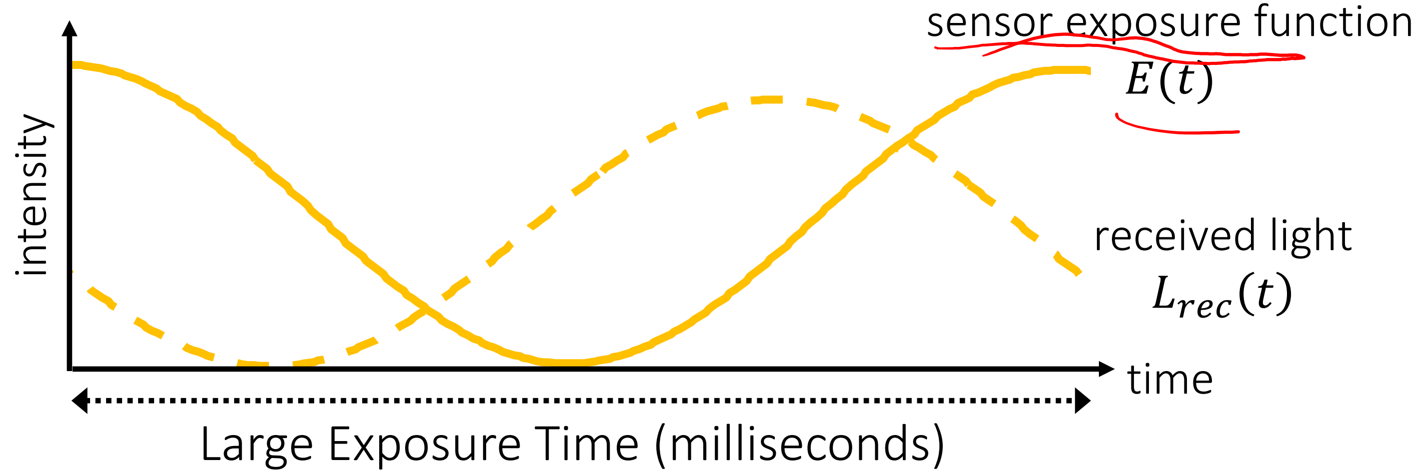
$$L_{rec}(t) = O_{rec} + A_{rec}\cos(\omega t - \phi_{rec})$$

Measuring phase shift: direct



Low Signal-to-Noise-Ratio

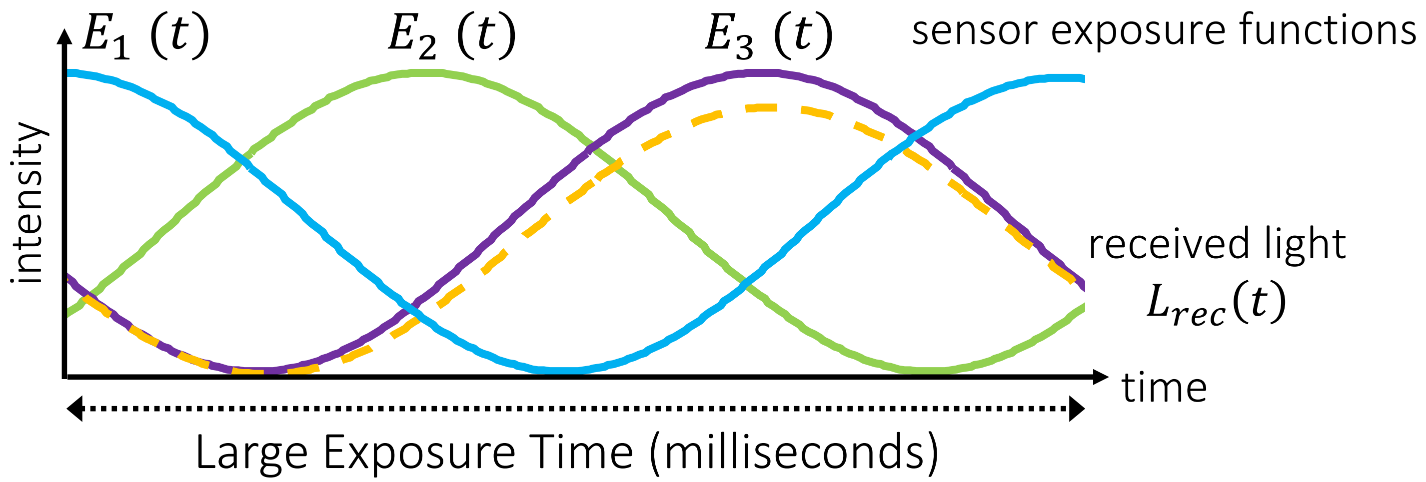
Measuring phase shift: correlation



Correlation: $I = \int E(t) \times L_{rec}(t)\, dt$

measured brightness — exposure function — received light

Measuring phase shift: correlation



Correlation 1: $I_1 = \int E_1(t) \times L_{rec}(t)\, dt$

Correlation 2: $I_2 = \int E_2(t) \times L_{rec}(t)\, dt$

Correlation 3: $I_3 = \int E_3(t) \times L_{rec}(t)\, dt$

High Signal-to-Noise Ratio

Real Time Capture

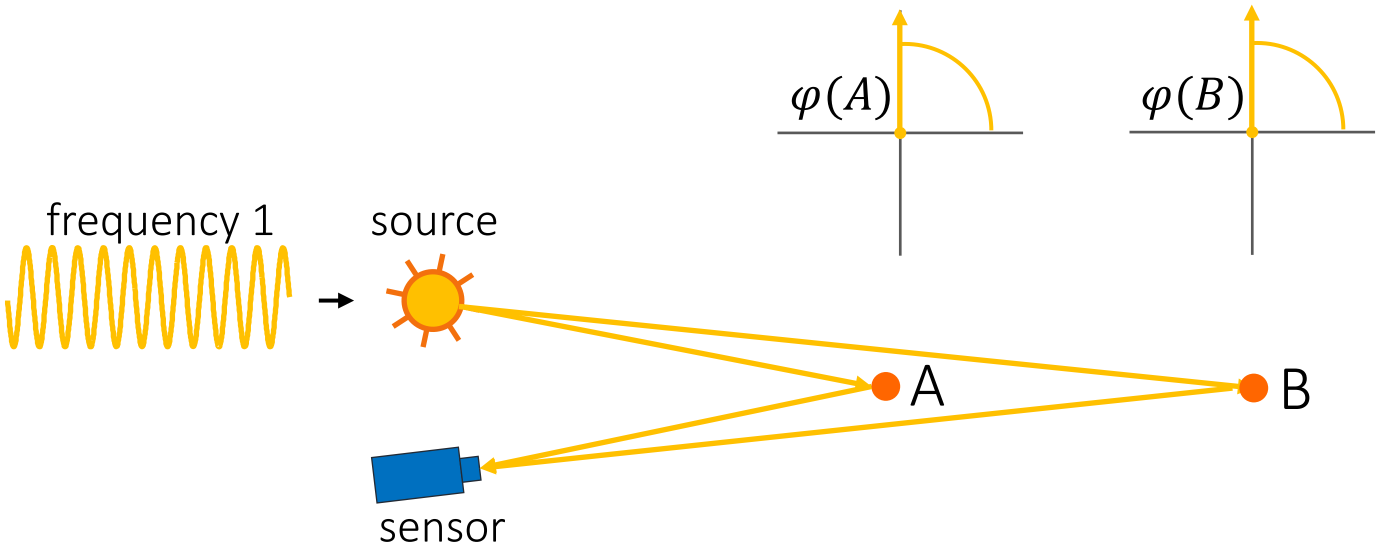
$depth$

$phase\ \varphi_{rec}$

$offset\ O_{rec}$

$amplitude\ A_{rec}$

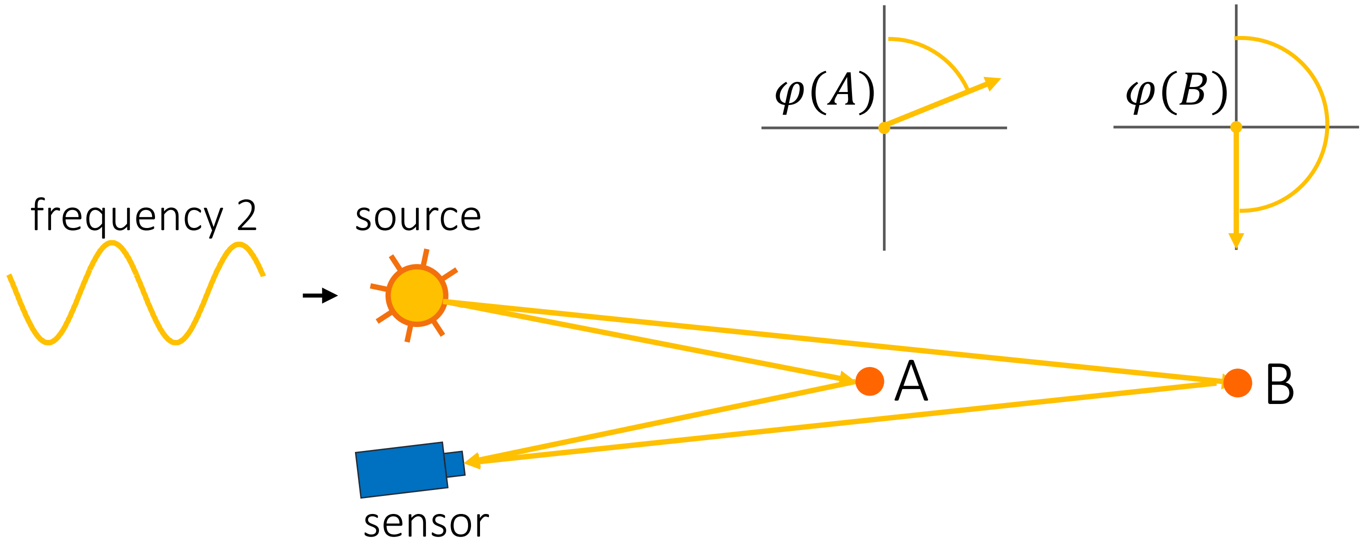
Phase ambiguity



Different Scene Depths Have Same Phase

- Also known as “phase wrapping”.

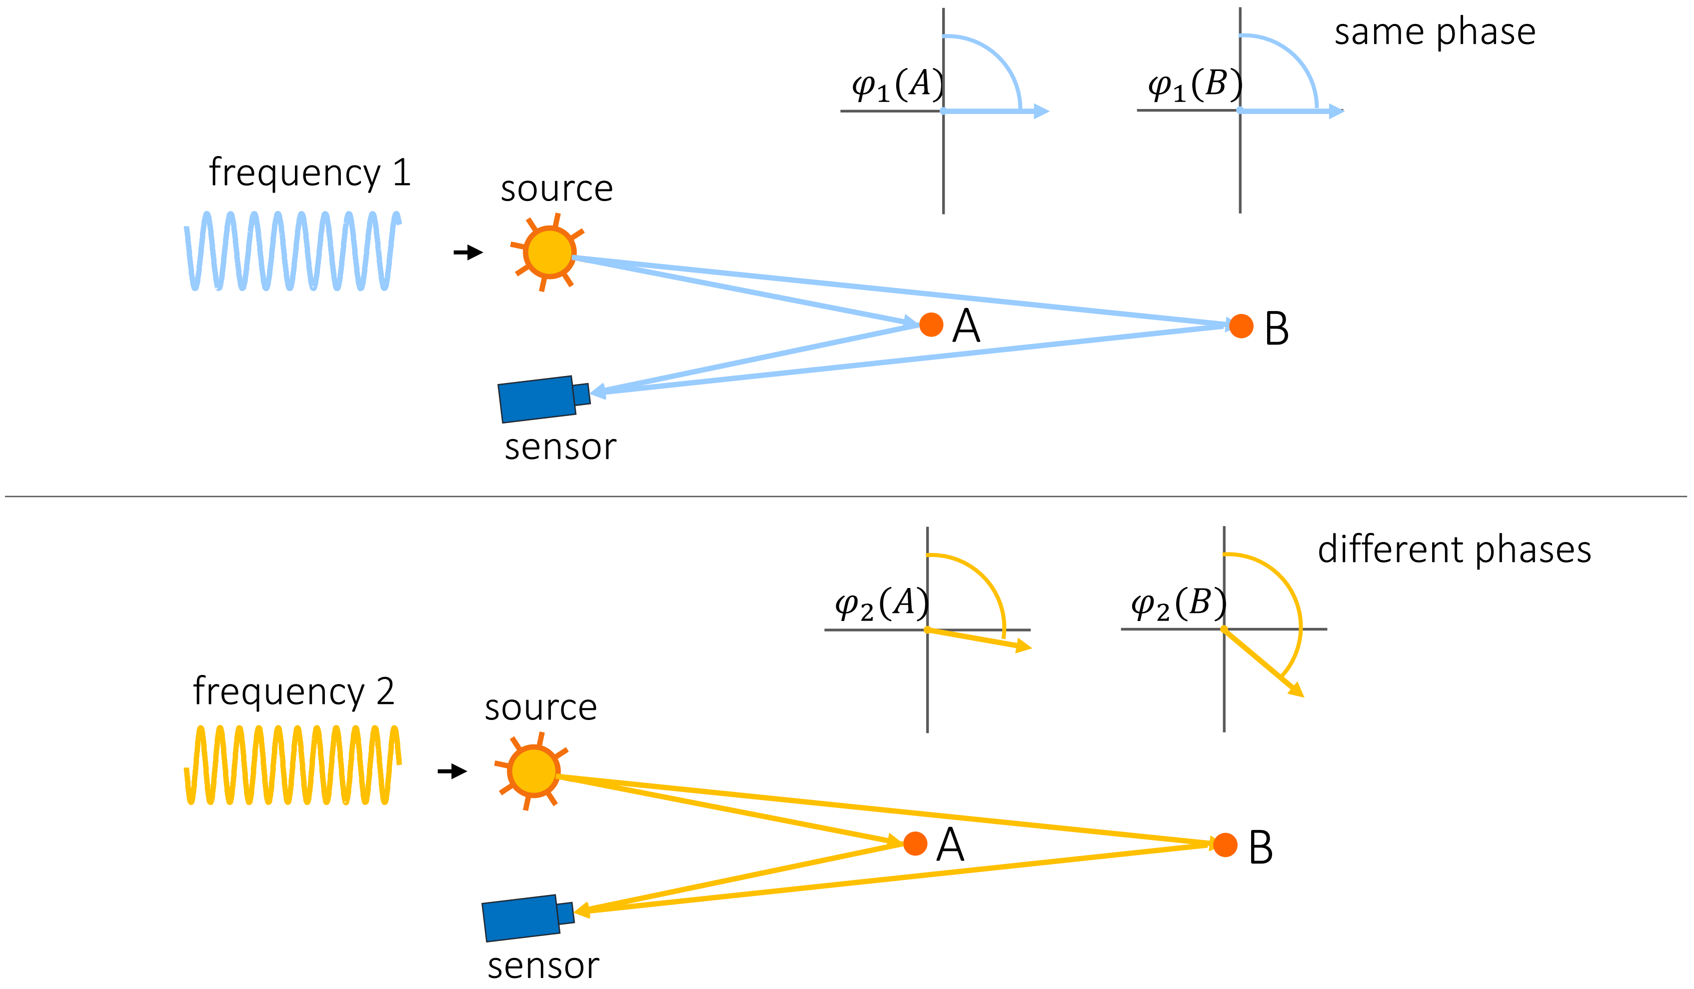
Phase ambiguity



Unambiguous Depth Range: $R_{unambiguous} = \frac{1}{2\omega}$

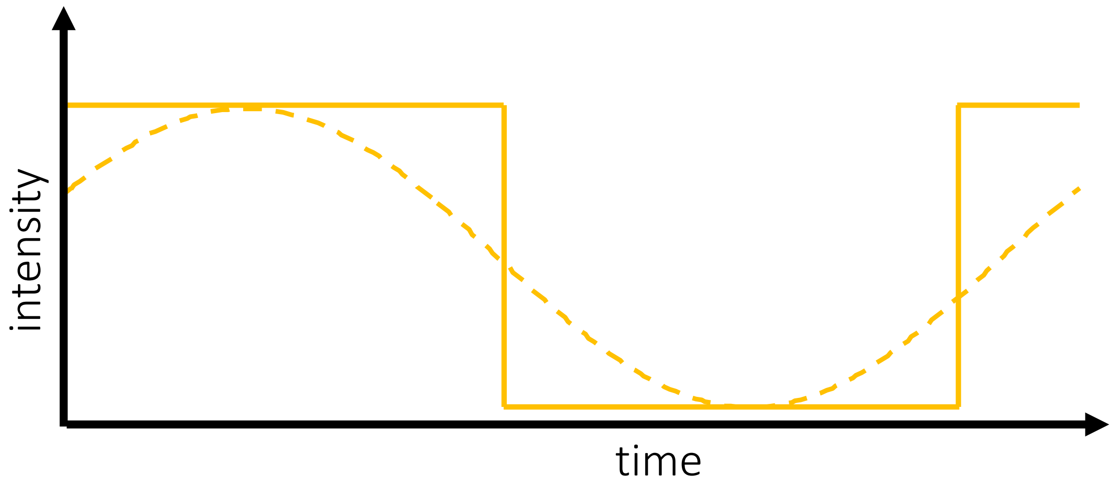
How can we resolve the phase ambiguity?

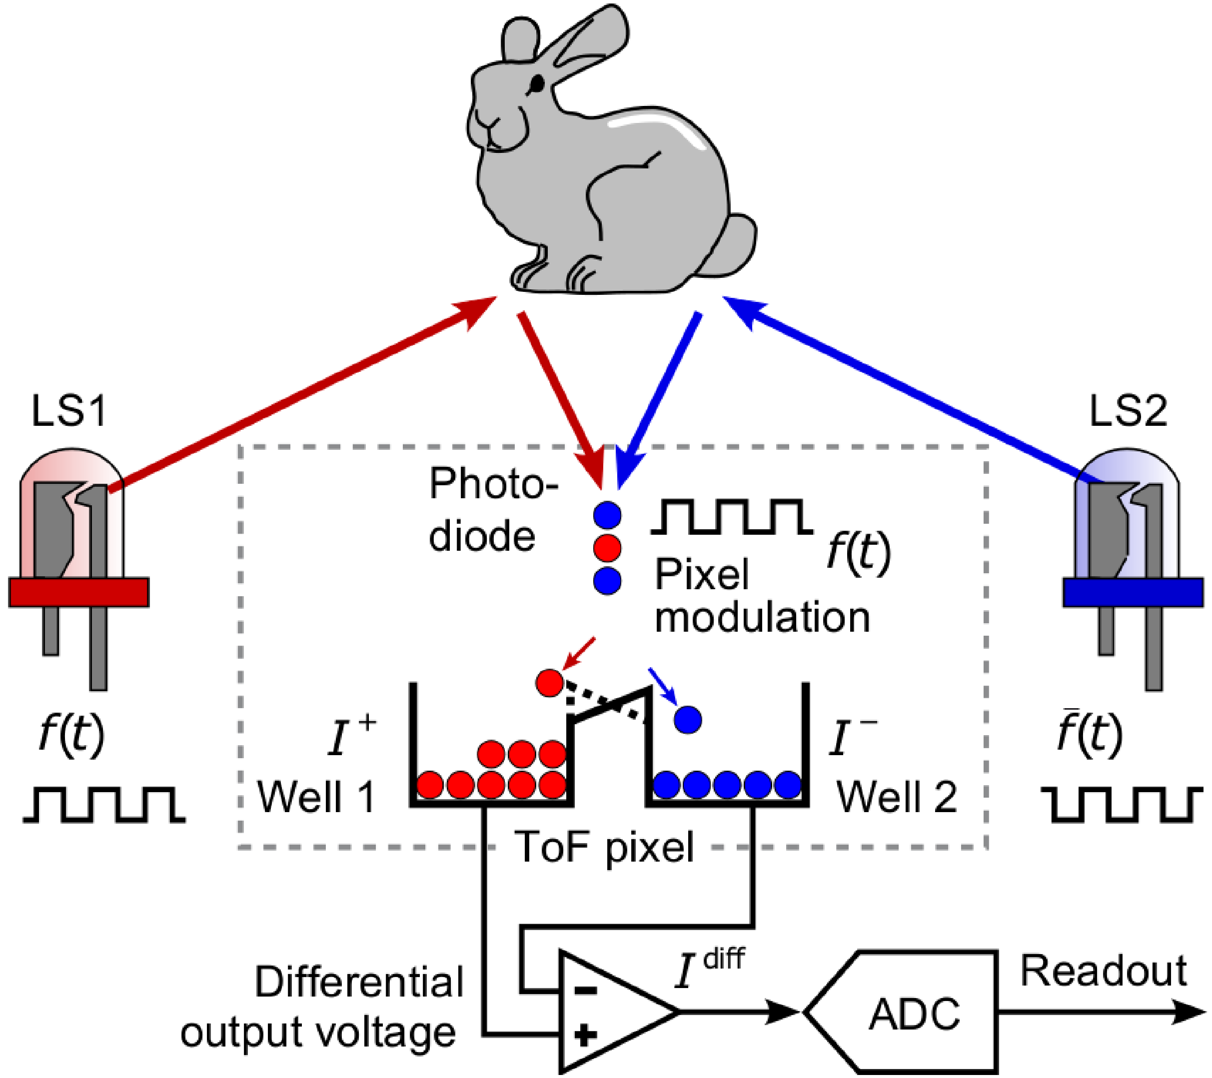
Disambiguating phase



Compute phases at two different frequencies

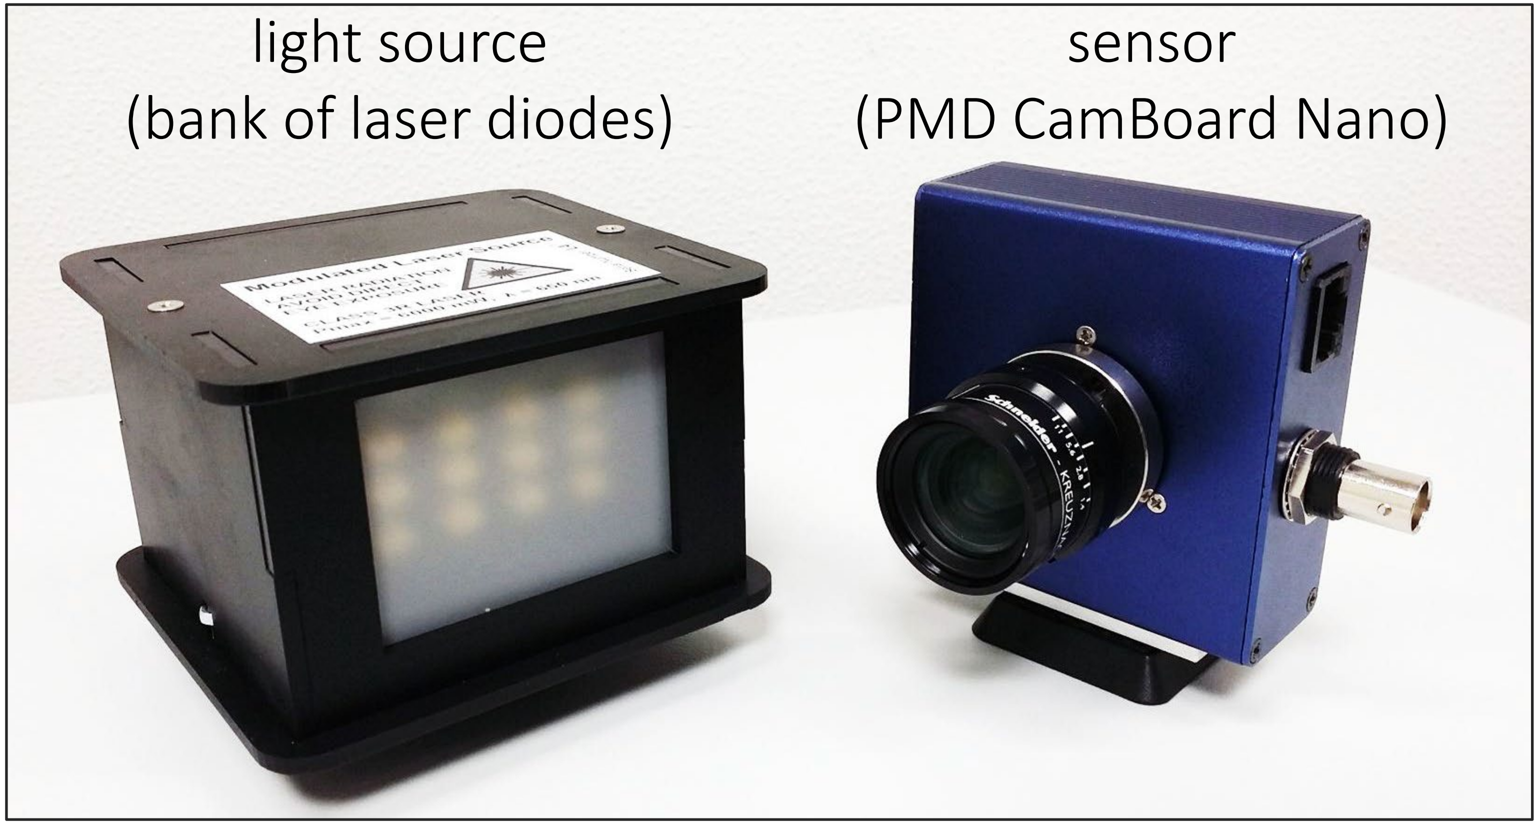
Implementation: two-well architectures



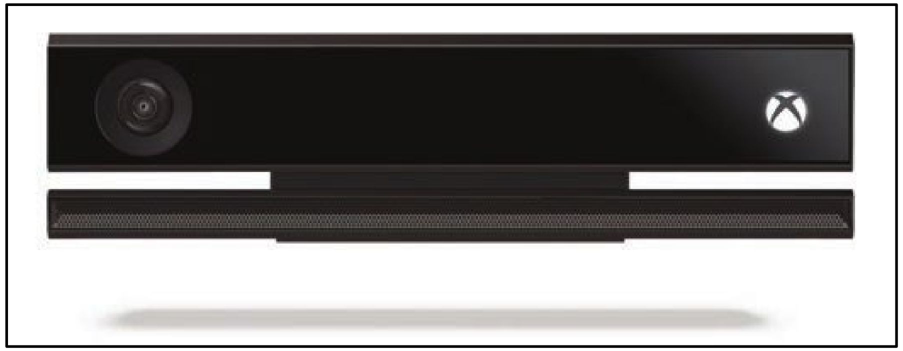


- approximate sinusoid with a square pulse
- store photons in different wells depending on whether they arrive at 1 or 0
- take difference between two wells

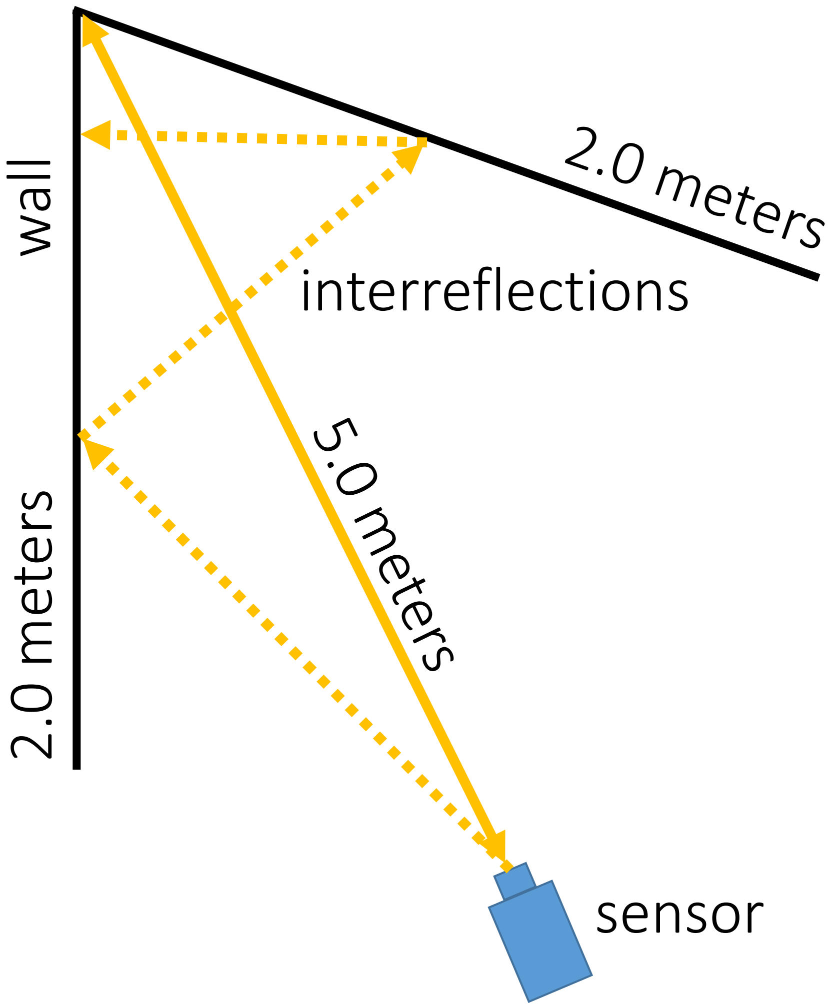
Some examples



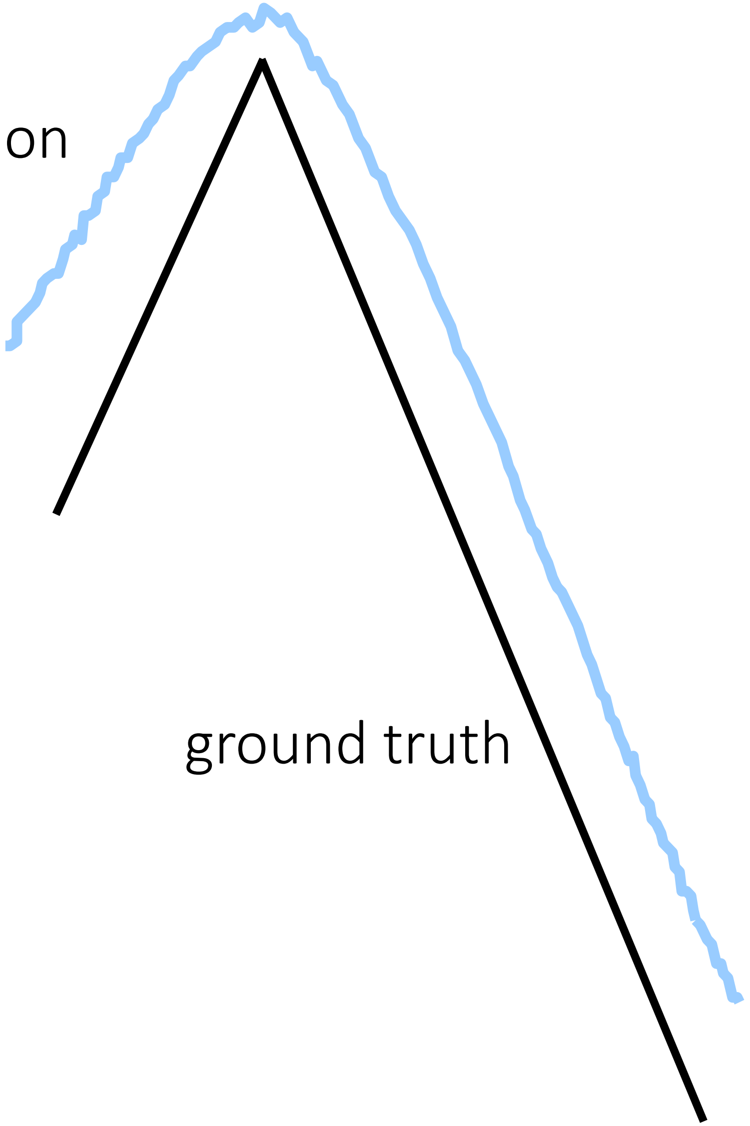
(only second generation of Kinect uses CW ToF)



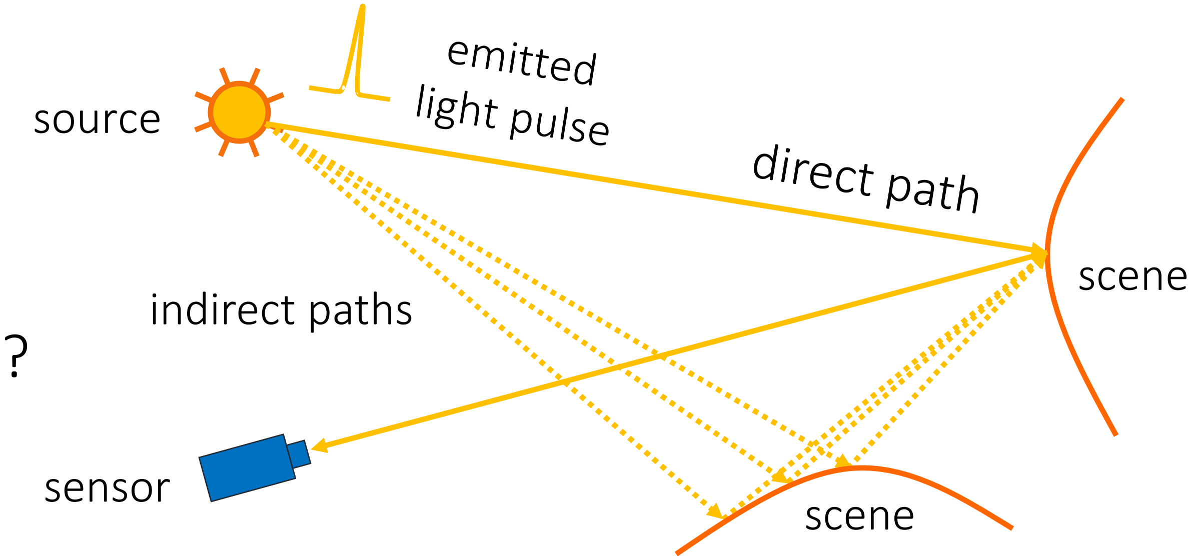
Multi-path interference



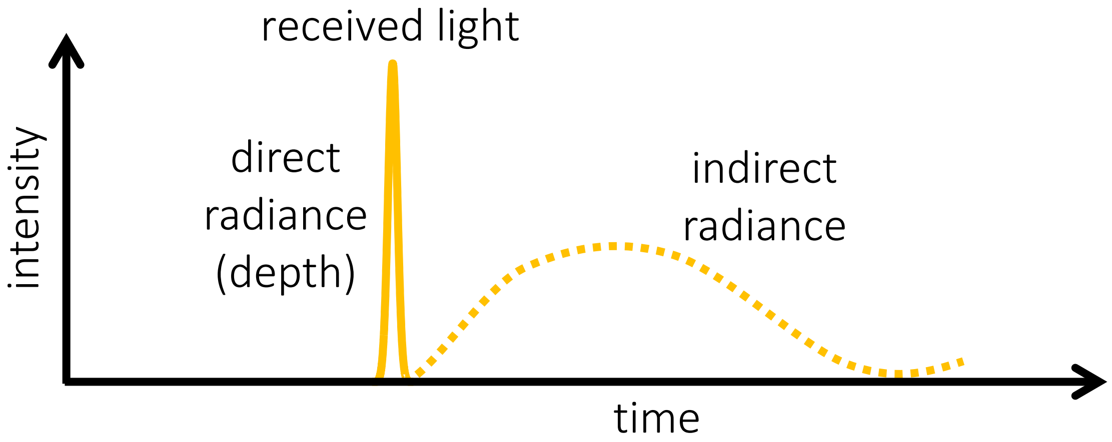
ToF depth reconstruction
mean error = 86.6 mm



Transient imaging with continuous-wave ToF



How do we do transient imaging in the CW-ToF case?

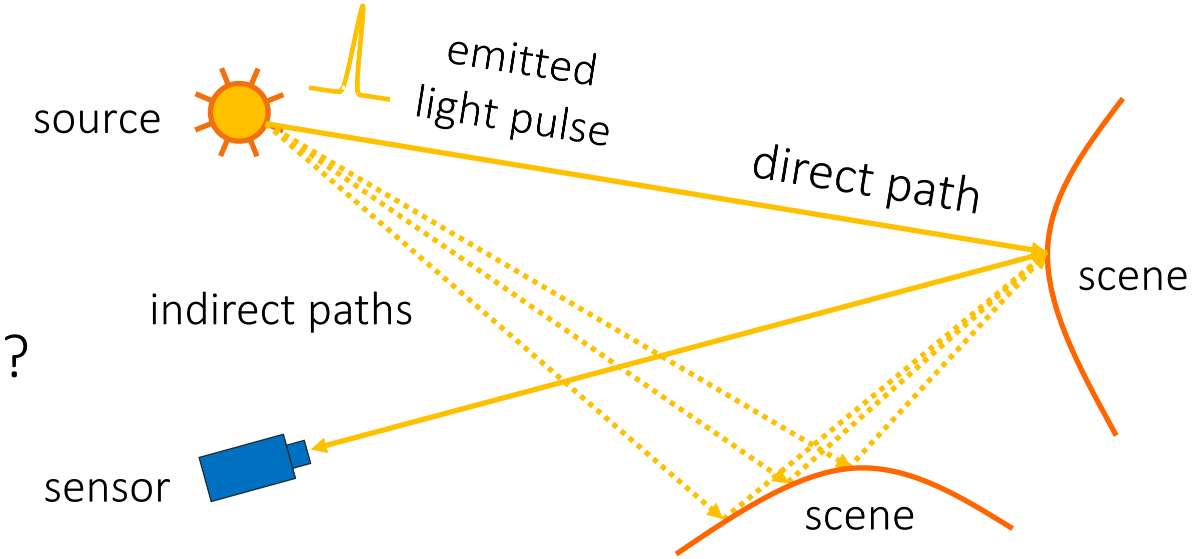


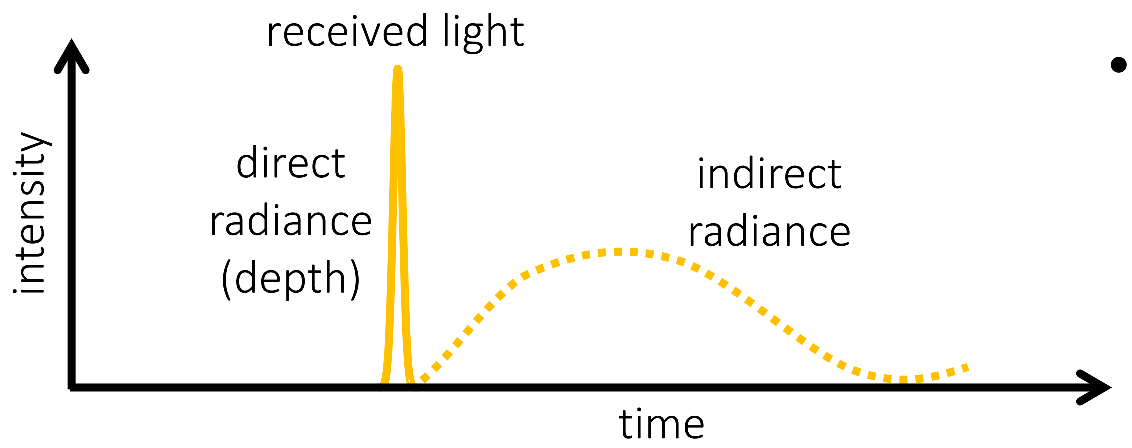
Transient I(t): Time-resolved radiance distribution

- Range imaging: Measuring only first returning photons (e.g., LIDAR).
- Transient imaging: Measuring entire transient (e.g., SPAD).

Transient imaging with continuous-wave ToF

How do we do transient imaging in the CW-ToF case?





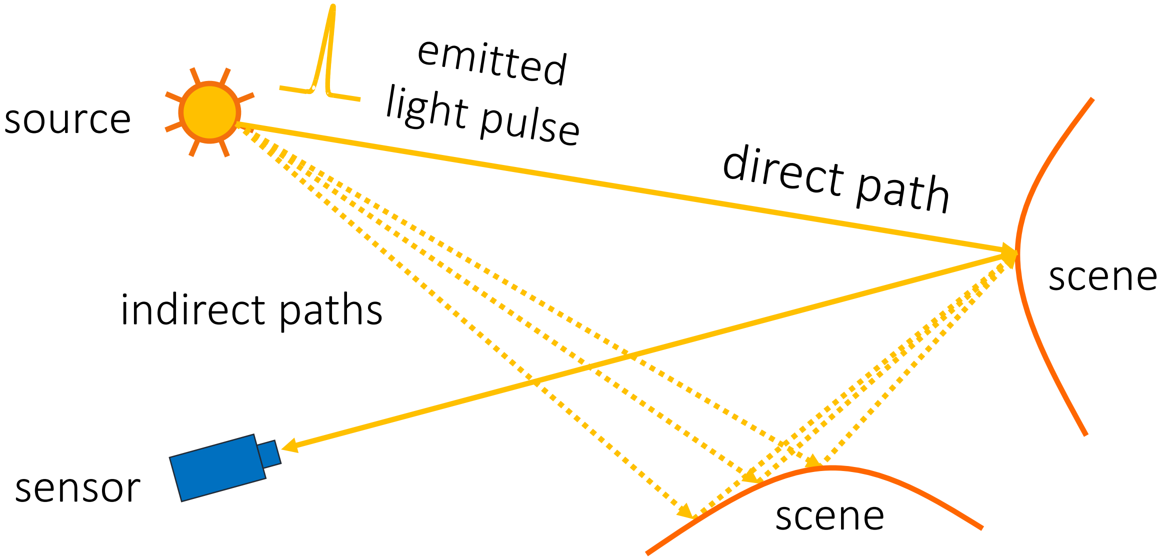
Transient I(t): Time-resolved radiance distribution

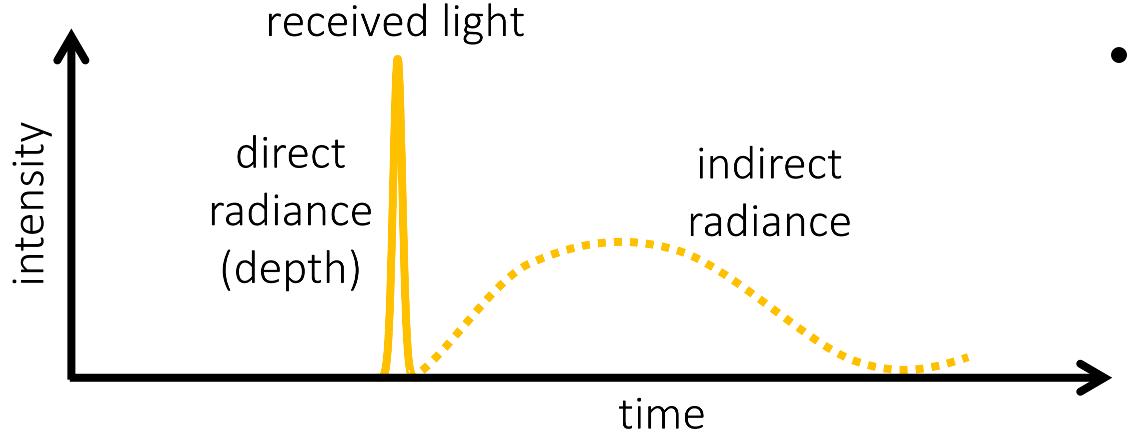
- Each measurement we capture is of the form:

$$I(\omega) = \int \sin(\omega t) \cdot I(t) dt$$

Transient imaging with continuous-wave ToF

How do we do transient imaging in the CW-ToF case?





Transient I(t): Time-resolved radiance distribution

- Each measurement we capture is of the form:

$$I(\omega) = \int \sin(\omega t) \cdot I(t) dt$$

We can do transient imaging by taking measurements at multiple frequencies ω, then doing an inverse Fourier transform

Interferometric ToF imaging

Time-of-flight imaging technologies

	interferometry	streak cameras	single-photon avalanche diodes	time-of-flight cameras	LIDAR
temporal resolution	1 femtosecond (10^{-15} secs)	1 picosecond (10^{-12} secs)	100 picoseconds (10^{-10} secs)	1 nanosecond (10^{-9} secs)	10 nanoseconds (10^{-8} secs)
frame rate	quadrillion fps	trillion fps	10 billion fps	billion fps	100 million fps
distance travelled	1 micron (10^{-6} meters)	1 millimeter (10^{-3} meters)	10 centimeters (10^{-1} meters)	1 meter (10^{-0} meters)	10 meters (10^{1} meters)
