## Overview of today's lecture

- Types of light paths.
- Light tracing.
- Bidirectional path tracing.

## Slide credits

Most of these slides were directly adapted from:

- Wojciech Jarosz (Dartmouth).

## Light Paths

## Light Paths

Express light paths in terms of the surface interactions that have occurred

A light path is a chain of linear segments joined at event "vertices"

## Heckbert's Classification

## Classification of "vertices":

- L : a light source
- $E$ : the eye
- $S$ : a specular reflection
- $D$ : a diffuse reflection

## Heckbert's Classification

## Heckbert's Classification

## Heckbert's Classification

## Heckbert's Classification

## Heckbert's Classification

## Heckbert's Classification

## Heckbert's Classification

Can express arbitrary classes of paths using a regular expression type syntax:

- $k^{+}$: one or more of event $k$
- $k^{*}$ : zero or more of event $k$
- $k$ ? : zero or one $k$ events
- (k|h) : a $k$ or $h$ event

## Heckbert's Classification

Direct illumination: $L(D \mid S) E$
Indirect illumination: $\quad L(D \mid S)(D \mid S)^{+} E$

## Heckbert's Classification

Direct illumination: $L(D \mid S) E$
Indirect illumination: $\quad L(D \mid S)(D \mid S)^{+} E$
Full global illumination: $\quad L(D \mid S)^{*} E$

## Diffuse inter-reflections: $L D D^{+} E$

## Caustics: $L^{+} D E$

## Subsurface Scattering

## A Simple Scene

## + Glass/Mirror Material

## Path Tracing Caustics

## Path Tracing Caustics

Random sampling of hemisphere will never hit the light source

## Let's just give it more time...

Nature $\sim 2 \times 10^{33}$ / second

## Fastest GPU ray tracer $\sim 2 \times 10^{8}$ / second

## Let's just give it more time...

## Path Tracing - Summary

$\checkmark$ Full solution to the rendering equation
$\checkmark$ Simple to implement
$X$ Slow convergence

- requires $4 x$ more samples to half the error
$X$ Robustness issues
- does not handle some light paths well (or not at all), e.g. caustics ( $L S^{+} D E$ )
$X$ No reuse or caching of computation
$X$ General sampling issue
- makes only locally good decisions

## Today's agenda

## Measurement Equation

## Path Integral Framework

Solving the Rendering Equation

- Light tracing
- Bidirectional path tracing

## Can we simulate this better?

## Light transport is symmetric

# Duality of Radiance and Importance 

## Measurement Equation

Rendering equation describes radiative equilibrium at point $\mathbf{x}$ :

$$
L_{o}\left(\mathbf{x}, \vec{\omega}_{o}\right)=L_{e}\left(\mathbf{x}, \vec{\omega}_{o}\right)+\int_{H^{2}} f_{r}\left(\mathbf{x}, \vec{\omega}_{i}, \vec{\omega}_{o}\right) L_{i}\left(\mathbf{x}, \vec{\omega}_{i}\right) \cos \theta_{i} d \vec{\omega}_{i}
$$

We are interested in the total radiance contributing to pixel $j$ :

$$
I_{j}=\int_{A_{\text {film }}} \int_{H^{2}} W_{e} \underbrace{}_{\begin{array}{l}
\text { response of the sensor at film location } \mathbf{x} \\
\text { to radiance arriving from direction } \vec{\omega} \\
\text { (often referred to as emitted importance) }
\end{array}}
$$

## Radiometry as Measurements

Weighted integral of 5D radiance function

$$
\int_{V} \int_{H^{2}} W_{e}(\mathbf{x}, \vec{\omega}) L(\mathbf{x}, \vec{\omega}) \mathrm{d} \vec{\omega} \mathrm{~d} \mathbf{x}
$$

Other radiometric quantities are measurements

- expressing irradiance in terms of radiance:

$$
\int_{H^{2}} L(\mathbf{x}, \vec{\omega}) \cos \theta d \vec{\omega}=E(\mathbf{x})
$$

Integrate radiance over hemisphere

- expressing flux/power in terms of radiance:

$$
\int_{A} \int_{H^{2}} L(\mathbf{x}, \vec{\omega}) \cos \theta d \vec{\omega} d A(\mathbf{x})=\Phi(A) \begin{aligned}
& \text { Integrate radiance over } \\
& \text { hemisphere and area }
\end{aligned}
$$

## Radiance vs. Importance

## Radiance

- emitted from light sources
- describes amount of light traveling within a differential beam

## Importance

- "emitted" from sensors
- describes the response of the sensor to radiance traveling within a differential beam

## Duality of Radiance \& Importance

$$
I_{j}=\int_{A_{\text {film }}} \int_{H^{2}} W_{e}(\mathbf{x}, \vec{\omega}) L_{i}(\mathbf{x}, \vec{\omega}) \cos \theta d \vec{\omega} d \mathbf{x}
$$

\end{aligned}
$$

Let's expand $L_{o}$ and consider direct illumination only

& \begin{array}{c}
\text { emitted quantities with } \\
\text { identical measure }
\end{array}
\end{aligned}

Advantages:

- no recursion, no "nasty" nested integrals
- emphasizes symmetry of light transport
- easy to relate different rendering algorithms
- focuses on path geometry, independent of strategy for constructing paths
- MC estimator on path space looks much simpler

## Bidirectional Path Tracing

Key observations:

- Every path (formed by connecting camera sub-path to light sub-path) with $k$ vertices can be constructed using $k+1$ strategies
- For a particular path length, all strategies estimate the same integral
- Each strategy has a different PDF, i.e., each strategy has different strengths and weaknesses
- Let's combine them using MIS!
