Texture and other Mappings

- Texture Mapping
- Bump Mapping
- Displacement Mapping
- Environment Mapping

Example: Checkerboard
- Particularly severe problems in regular textures
The Beginnings of a Solution: Mipmapping

- Pre-calculate how the texture should look at various distances, then use the appropriate texture at each distance. This is called *mipmapping*.
- “Mip” → “multum in parvo” or “many things in a small place”
- Each mipmap (each image below) represents a level of resolution.
- Powers of 2 make things much easier.

The Beginnings of a Solution

- Problem: Clear divisions between different depth levels
- Mipmapping alone is unsatisfactory.
Another Component: Filtering

- **Anisotropic filtering**
  - Basic filtering methods assume that a pixel on-screen maps to a square (isotropic) region of the texture
  - For surfaces tilted away from the viewer, this is not the case!

Or design the mapping by hand

For each triangle in the model establish a corresponding region in the phototexture

During rasterization interpolate the coordinate indices into the texture map
Uses for Texture Mapping

Use texture to affect a variety of parameters

- surface color - color (radiance) of each point on surface
  (Catmull 1974)
- surface reflectance - reflectance coefficients $k_d$, $k_p$, or $n_{shiny}$
- normal vector - bump mapping (Blinn 1978)
- geometry - displacement mapping
- transparency - transparency mapping (clouds) (Gardener 1985)
- light source radiance - environment mapping (Blinn 1978)
Radiance vs. Reflectance Mapping

Texture specifies (isotropic) radiance for each point on surface

Bump Mapping: A Dirty Trick

- Which spots bulge out, and which are indented?
- Answer: None! This is a flat image.
- The human visual system is hard-coded to expect light from above
- In CG, we can perturb the normal vector without having to make any actual change to the shape.
Bump Mapping

- Basic texture mapping paints on to a smooth surface
- How do you make a surface look rough?
  - Option 1: model the surface with many small polygons
  - Option 2: perturb the normal vectors before the shading calculation

![Real Bump](image1) + ![Fake Bump](image2) = ![Flat Plane](image3)

Sphere w/Diffuse Texture Map + Bump Map = Sphere w/Diffuse Texture + Bump Map

- We can perturb the normal vector without having to make any actual change to the shape.
- This illusion can be seen through—how?

Original model (5M) + Simplified (500) = Simple model with bump map
**Bump Mapping**

[Image of a horse with bump mapping applied]

---

**Another Bump Mapping Example**

- Cylinder w/Diffuse Texture Map
  + Bump Map
  = Resulting cylinder with bump mapping

*Image showing the process of adding a bump map to a cylinder.*
Displacement Mapping

• Use texture map to displace each point on the surface
  – Texture value gives amount to move in direction normal to surface

• How is this different from bump mapping?

Environment Mapping

Specular reflections that mirror the environment

Cube is a natural intermediate object for a room

Environment Mapping: Cube Maps
Basics of Texture Mapping in OpenGL

Glubyte my_texels[512][512][3];
GLuint texID;

glGenTextures(1, &texID);
glBindTexture(GL_TEXTURE_2D, texID);
glTexImage2D(GL_TEXTURE_2D, 0, GL_RGB, 512, 512, 0,
            GL_RGB, GL_UNSIGNED_BYTE, my_texels);
/* level, components, w, h, border, format, type, tarray */

/* assign texture coordinates */
glEnable(GL_TEXTURE_2D);
glBegin(GL_QUAD);
glTexCoord2f(0.0, 0.0);
glVertex3f(x1, y1, z1);
glTexCoord2f(1.0, 0.0);
glVertex3f(x2, y2, z2);
glTexCoord2f(1.0, 1.0);
glVertex3f(x3, y3, z3);
glTexCoord2f(0.0, 1.0);
glVertex3f(x4, y4, z4);

glEnd();
glDisable(GL_TEXTURE_2D);

Grungy details we’ve ignored

• Specify s or t out of range? Use GL_TEXTURE_WRAP in
glTexParameteri because many textures are carefully designed to
repeat

• Aliasing? Mapping doesn’t send you to the center of a texel. Can
average nearest 2x2 texels using GL_LINEAR

• Mipmapping: use textures of varying resolutions. 64x64 becomes
32x32, 16x16, 8x8, 4x4, 2x2 and 1x1 arrays with
gluBuild2DMipmaps
Texture Generation

Photographs
Drawings
Procedural methods (2D or 3D)
  Associate each x,y,z value directly with an s,t,r value in the texture block (sculpting in marble and granite)

Procedural Methods

Reaction-Diffusion
Greg Turk, Siggraph ‘91
Solid Textures

• Have a 3-D array of texture values (e.g., a block of marble)
  – Use a function [xyz] -> [RGB] to map colors to points in space
• Such a 3D map is called a *solid texture map*
• In practice the map is often defined procedurally
  – No need to store an entire 3D array of colors
  – Just define a function to generate a color for each 3D point
• The most interesting solid textures are random ones
  – a great marble algorithm has now become cliché
• Evaluate the texture coordinates in object coordinates - otherwise moving the object changes its texture!
