## Sensor and Touch-Based Reflex Grasping Methods

Paulo Camasmie

16848 Design and Control for Dexterous Manipulation | Spring 2020 Professor Nancy Pollard

# Enhancing Adaptive Grasping Through a Simple Sensor-Based Reflex Mechanism

Emanuele Luberto<sup>1</sup>, Yier Wu<sup>1</sup>, Gaspare Santaera<sup>2</sup>, Marco Gabiccini<sup>1</sup>, and Antonio Bicchi<sup>1,2</sup>

<sup>1</sup>Universita di Pisa

<sup>&</sup>lt;sup>2</sup>Instituto Italiano di Tecnologia

#### Method

- Preliminary grasp planned based on rough estimates
- Hand positioned and shaped to pre-grasp position
- Adaptive Sensor based algorithm
  - Wrist pose
  - Hand closure
- Object uniformly approached by all fingers

## Pisa/IIT Softhand with IR Sensors

#### Cost Function

All sensor measurements collected

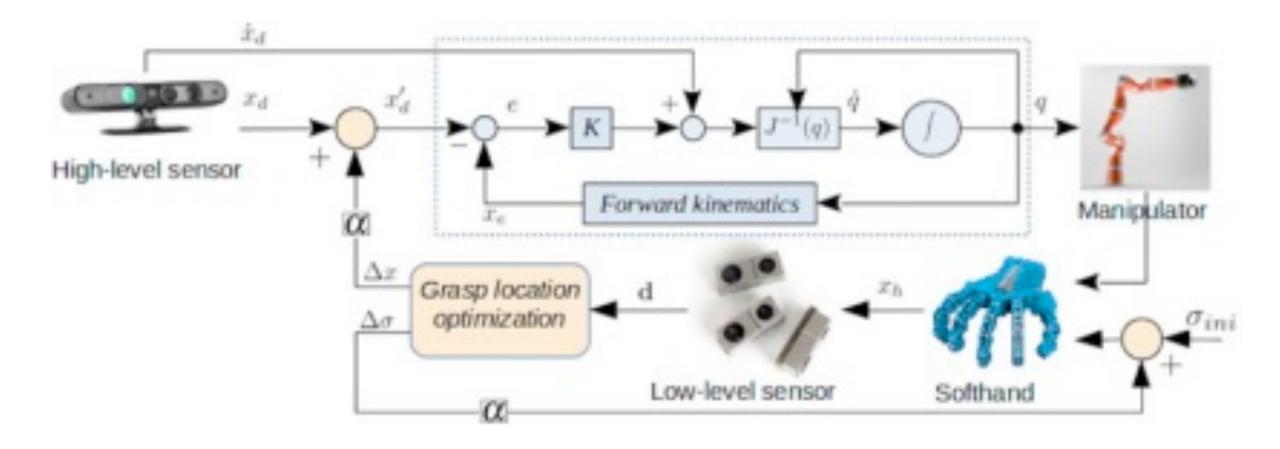

$$\mathbf{d} = [d_1, d_2, \dots, d_n]^T$$

Minimize Residual at every time step

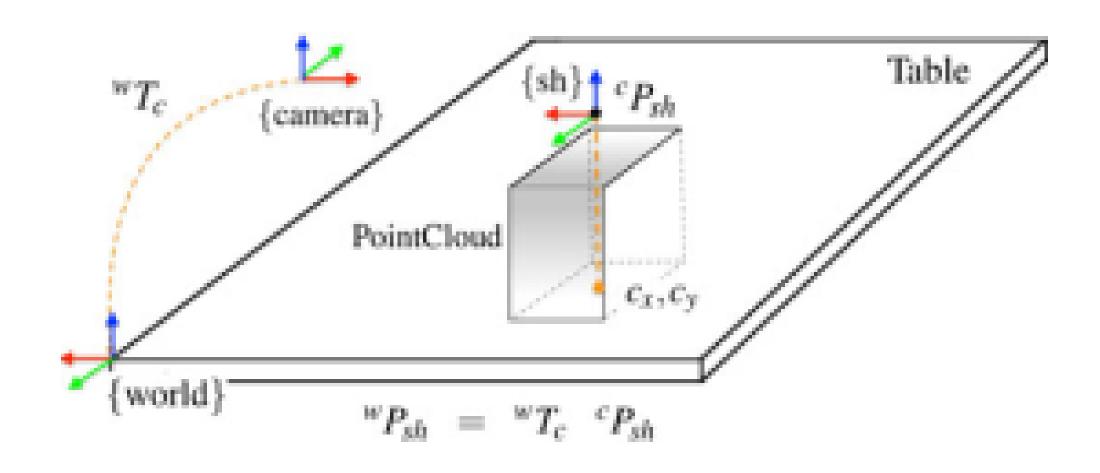

$$\min_{\mathbf{x}} f(\mathbf{x}), \text{ where } f(\mathbf{x}) = \frac{1}{2} \mathbf{r} (\mathbf{x})^T \mathbf{r} (\mathbf{x})$$

$$\mathbf{x} = [p_x, p_y, p_z; r_x, r_y, r_z; \sigma]^T$$

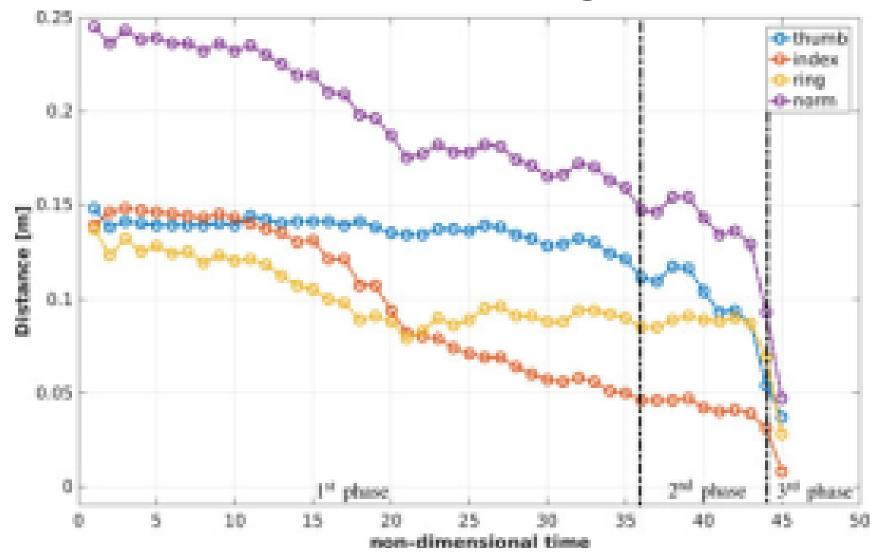

#### Control

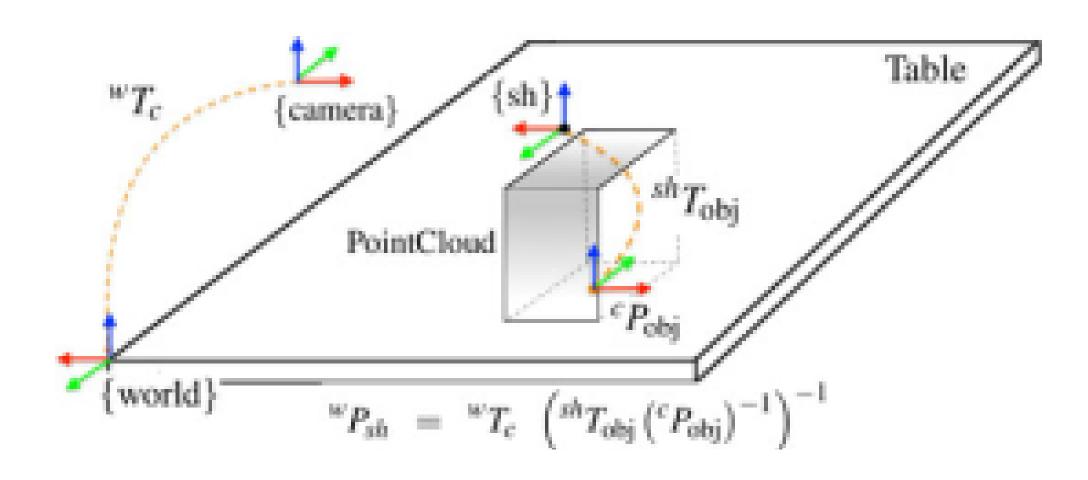

## Approximate Object Position: Method 1

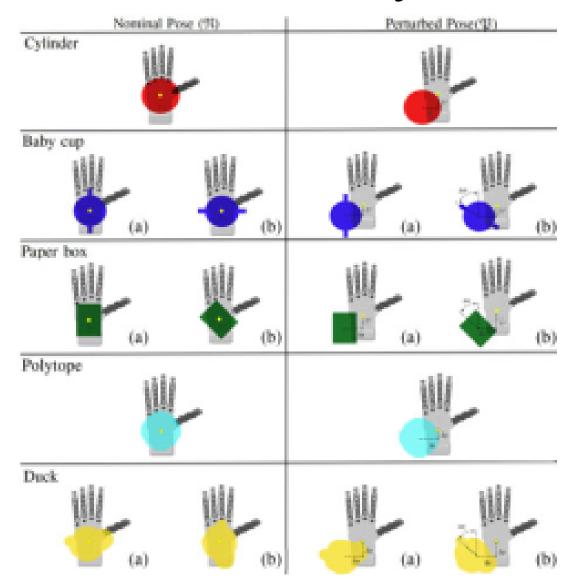

## Sensor measurements during execution

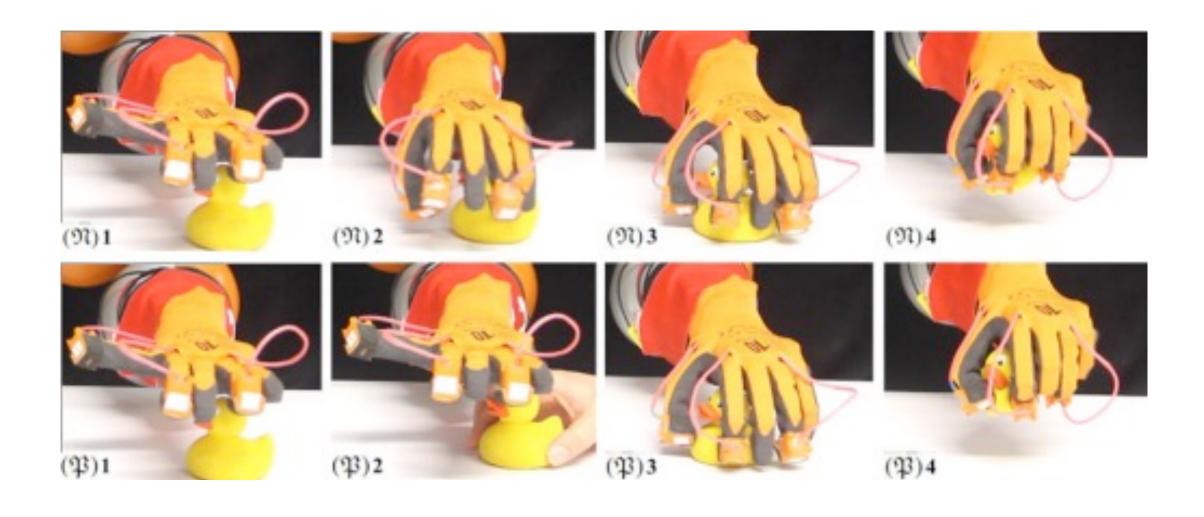

## Approximate Object Position: Method 2

## Nominal and Perturbed Object Poses

## IR-Guided Grasp: Rubber Duck

## Results

| Object and reference pose | Nominal Pose (M) |               |                   | Perturbed Pose (P) |                   |
|---------------------------|------------------|---------------|-------------------|--------------------|-------------------|
|                           | Blind<br>(M1)    | Blind<br>(M2) | IR-guided<br>(M1) | Blind<br>(M2)      | IR-guided<br>(M2) |
| Cylinder                  | 0/3              | 2/3           | 3/3               | 0/3                | 2/3               |
| Baby cup, pose (a)        | 0/3              | 3/3           | 2/3               | 0/3                | 2/3               |
| Baby cup, pose (b)        | 1/3              | 3/3           | 3/3               | 0/3                | 2/3               |
| Paper box, pose (a)       | 0/3              | 3/3           | 2/3               | 0/3                | 2/3               |
| Paper box, pose (b)       | 1/3              | 3/3           | 3/3               | 0/3                | 2/3               |
| Polytope                  | 1/3              | 3/3           | 3/3               | 0/3                | 3/3               |

#### First Author: Matteo Bianchi

- Assistant Professor Centro di Ricerca "E. Piaggio", Univesita de Pizza
- Clinical research affiliate at Mayo Clinic (Rochester, USA)
- Co-Chair of the RAS Technical Committee on Robot Hands, Grasping and Manipulation
- Principal Investigator of the EU Project SoftPro

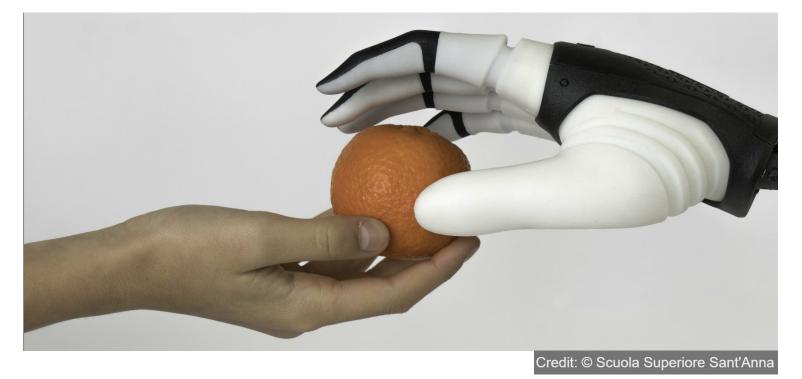

• Editor of the book "<u>Human and Robot Hands</u>", Springer International Publishing

#### Goal

• Explore the potential of Soft End Effectors(SEEs) in human robot interaction

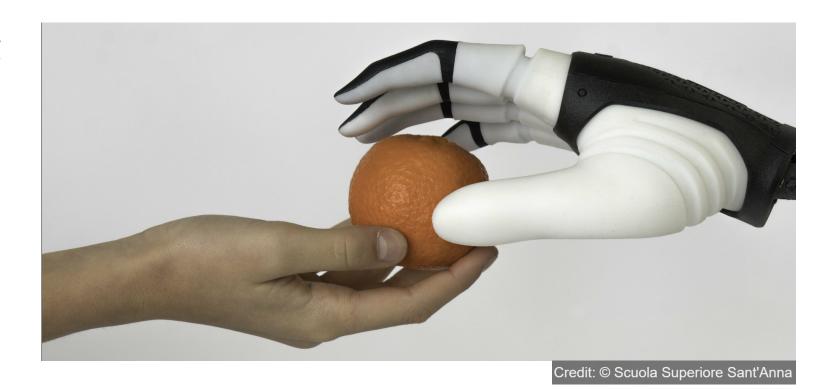

• Introduce a simple touch-based approach for human-to-robot

handover

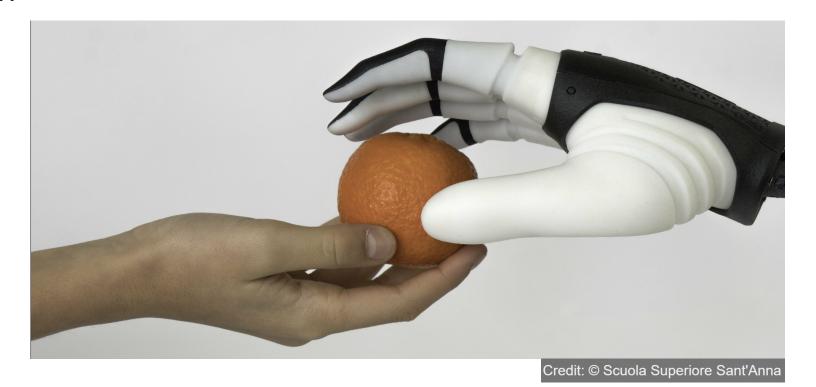

## Human-robot handover: Challenges

- Communication
- Prediction
- Safety
- Planning

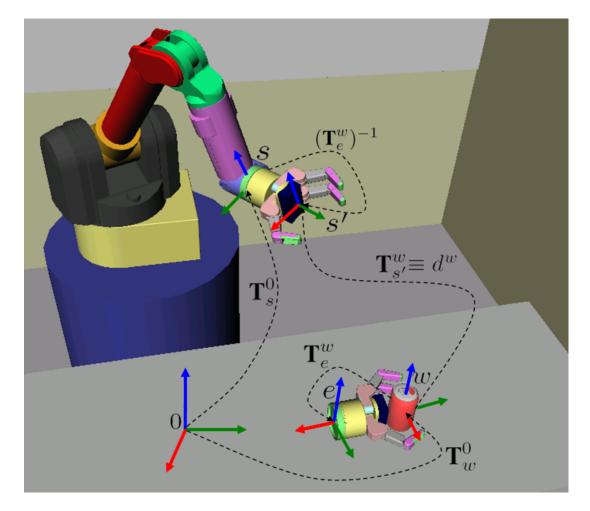

## Human-robot handover: phases

- Approach
- Passing ← This paper
- Retraction

#### Previous Work

- Sensors: Visual and tactile
- Analytic and data-driven approaches
  - Grasp planning
  - Grasp adaptation
  - Force control

Picture: ARM Lab University of Michigan

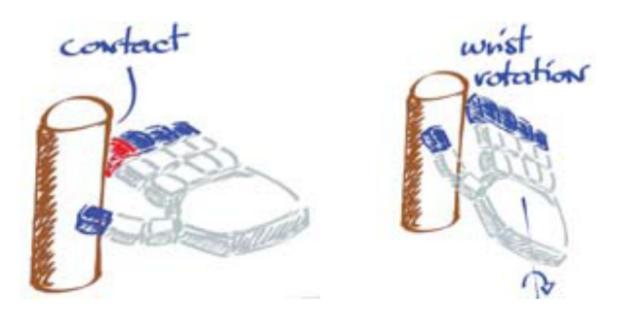

#### Previous Work: Reactive Behavior

- Evidence
  - Soft hand molds around items
  - Rough estimate object geometry and robot hand pose
  - short-range or non-ranged sensors  $\rightarrow$  more effective grasping

#### Main Idea = Contribution

- Inertial Measurement Units(IMUs) at fingertips
- Sensory-motor primitives in human-to-robot handover

(a) Contact detection. (b) Primitive trigger.

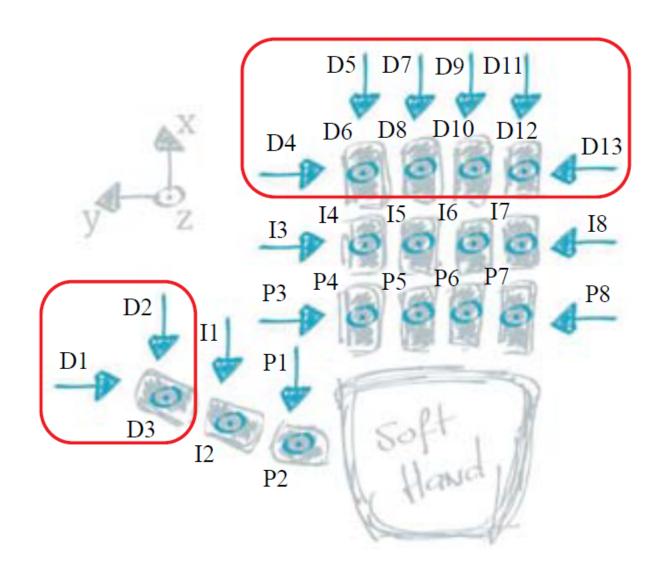

(c) Grasp.

## Method: Hardware

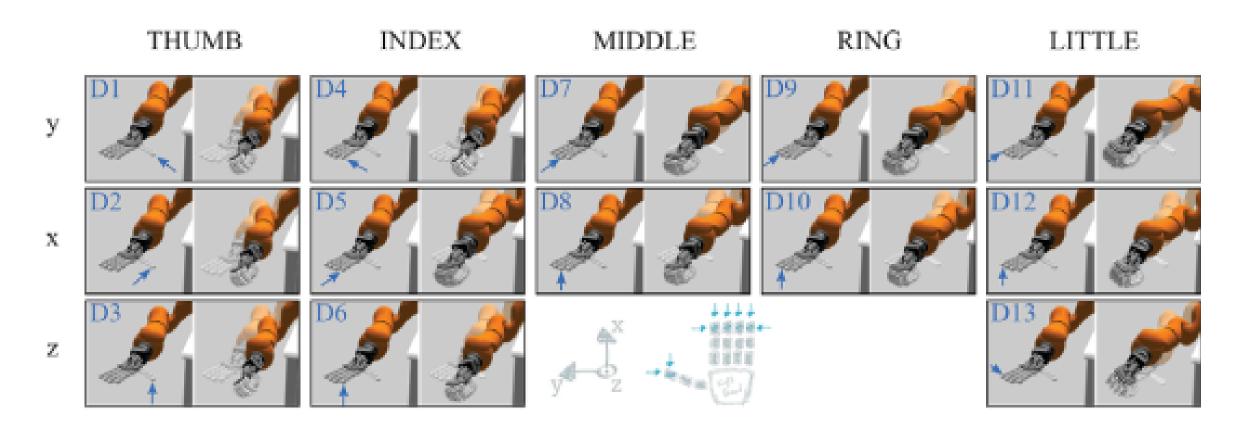

#### Method: Contacts and Directions

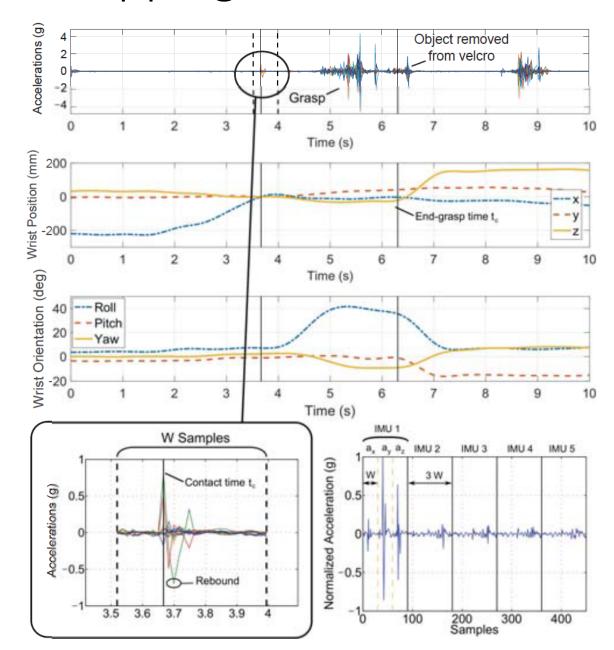

## Method: Acquisition Phase

## Method: Grasp Primitives

### Method: Mapping Acceleration to Wrist Pose

Acceleration > 0.5g followed by rebound = Initial contact

## Method: Experiment

- Kuka Light Weight Robot 4+
- Same sensorized glove on SH
- Hand facing down
- Successful grip >= 15 seconds
- Disturbed by experimenter
- Release if acceleration > 0.5g

## Results: Objects

| (A) screwdriver  | (B) wrench         | (C) reel              |
|------------------|--------------------|-----------------------|
| (D) battery (AA) | (E) pincers        | (F) plier             |
| (G) hammer       | (H) hotglue gun    | (I) caliper           |
| (J) pen          | (K) stapler        | (L) bottle            |
| (M) torch        | (N) computer mouse | (O) cell phone        |
| (P) eraser       | (Q) lighter        | (R) table tennis ball |
| (S) human hand   | (T) mug            | (U) can               |
| (V) teddy bear   |                    |                       |

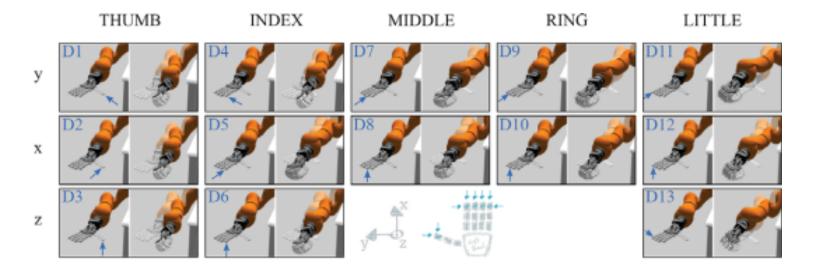

Average success rate = 86%

#### Lowest:

- Offset CoM
- Failure contact at Distal Phalanx ring and little finger
- (G) Hammer
- (I) Caliper
- (L) Bottle (had fluid inside)

| Object | Successes | Failures | Success % |
|--------|-----------|----------|-----------|
| (A)    | 71        | 16       | 81.61%    |
| (B)    | 84        | 3        | 96.55%    |
| (C)    | 77        | 10       | 88.51%    |
| (D)    | 78        | 9        | 89.66%    |
| (E)    | 77        | 10       | 88.51%    |

| P8         | 35        | 31       | 53.03%    |

## Experiment on a table: Reactive Grasping

#### Conclusion

- Generalizes wheel
- Autonomous grasping
- Different objects
- Different points of contatcs
- Big potential for autonomous tasks
  - Robot
  - Assistive robotics
    - user intention captured by sensors
    - task accomplished by primitives

#### Future Work

- More complex designs during data capture to allow roll, pitch & yaw
  - Actuated artificial wrist
- Unstructured environments
- Feedback control
- Additional sensors: IMUs and force sensor
- Use a larger number of naive human users
- More extensive quantitative comparison success with and without primitives
- Try same method on other kinds of hand designs (source: author)

#### Discussion

- Why 13 primitives. Would more have helped?
- Benefit of more sensors?
- Benefit of more flexibility while testing? Not limiting to roll only
- Would this work on rigid hand?
- Big Ones:
  - Are these local sensor reactive control approaches valid methods for grasping in the wild?
  - Could this sensor  $\rightarrow$  primitive mapping be implemented even more simply?
  - Is grasping primitives mapping a good policy? Different sensors?
     Reinforcement learning?
